## EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q25-Q30):

### NEW QUESTION # 25

Question:

A company is concerned about the risk of data loss due to accidental deletion and hardware failures. What is the primary reason for implementing a data backup solution?

- A. To maintain business continuity
- B. To improve application performance
- C. To reduce the usage of archive storage
- D. To reduce storage costs

**Answer: A**

Explanation:

The primary purpose of a data backup solution is to maintain business continuity by ensuring data can be restored in case of accidental deletion, hardware failure, or data corruption.

\* Not to reduce storage costs: Archiving and tiering handle that.

\* Not to improve application performance: Backup processes typically don't enhance live performance.

\* Not to reduce archive usage: Backup and archive have different use cases.

### NEW QUESTION # 26

Question:

What is the main advantage of a write-through operation in cache write I/O operations?

- A. Reduced write-response time
- **B. Enhanced data security**
- C. Low risk of data loss
- D. No impact to host I/O performance

**Answer: B**

Explanation:

In write-through caching, data is written simultaneously to both the cache and the underlying disk. This ensures data integrity because the write is not acknowledged until it's safely written to the disk.

\* Write-back caching offers reduced latency but increases risk of data loss if cache is lost.

\* Write-through trades speed for security, offering enhanced data security and reducing the risk of data loss during power failures.

### NEW QUESTION # 27

Question:

Which operations management process is responsible for maintaining information about configuration items (CIs)?

- A. Capacity management
- B. Change management
- **C. Configuration management**
- D. Performance management

**Answer: C**

Explanation:

Configuration Management is the process that ensures all configuration items (CIs) are identified, tracked, and maintained throughout their lifecycle. It maintains a Configuration Management Database (CMDB) that records the relationships and configurations of various components in the IT environment.

### NEW QUESTION # 28

Question:

(Refer to exhibit diagram)

The diagram shows a SAN zoning configuration with three zones: Zone 1 (Mixed), Zone 2 (WWN), and Zone 3 (Port). Which zoning type is used in Zone 2?

- A. Mixed zoning
- B. No zoning
- **C. WWN zoning**
- D. Port zoning

**Answer: C**

Explanation:

WWN zoning uses the World Wide Names (unique identifiers) of devices (HBAs and targets) to define zone membership.

Offers flexibility: devices can be moved to different ports without reconfiguring zoning.

Common in modern SAN environments.

\* Port zoning uses physical port numbers for zone membership.

\* Mixed zoning combines port and WWN methods.

\* No zoning would not segment traffic.

### NEW QUESTION # 29

Question:

A company needs to rebuild a failed disk in its RAID 5 array. Which two factors would significantly impact the rebuild time?

- A. Capacity of the failed disk
- B. Write performance of the remaining disks
- C. Network bandwidth between the server and the storage array
- D. Capacity of the cache memory

**Answer: A,B**

Explanation:

Rebuilding a RAID 5 array after a disk failure depends on:

Capacity of the failed disk (C)- More data means longer rebuild time.

Write performance of the remaining disks (B)- Rebuild involves recalculating parity and writing data to the replacement disk, which stresses the surviving disks.

\* Network bandwidth (A) is only relevant for accessing the array, not for internal rebuild operations.

\* Cache capacity (D) helps performance in some scenarios, but the direct factors are disk size and performance.
