- **B. A frame being transmitted from an AP to a client STA**
- C. A frame being transmitted directly from one client STA to another
- D. A frame being transmitted in a mesh BSS

**Answer: B**

**NEW QUESTION # 45**

**NEW QUESTION # 46**

Which piece of information is not transmitted in an HT PPDU header?

- **A. Channel number**
- B. PPDU length
- C. MCS index
- D. Number of Spatial Streams

**Answer: A**

Explanation:

The channel number is not transmitted in an HT PPDU header. An HT PPDU header is a part of the PPDU that contains information such as modulation, coding, data rate, and number of spatial streams for an 802.11n transmission. The channel number is not included in the HT PPDU header, as it is determined by the frequency band and channel width that are used by the transmitter and receiver. The channel number can be inferred from the frequency band and channel width, which are indicated by bits in different fields of the HT PPDU header, such as HT-SIG and HT-LTF. The other options are not correct, as they are transmitted in an HT PPDU header. The number of spatial streams, PPDU length, and MCS index are indicated by bits in the HT-SIG field of the HT PPDU header. **NEW QUESTION # 47**

You are concerned with management overhead in your WLAN. When evaluating the network, you note that each dual-band AP provides for 4 SSIDs in each band with three secure SSIDs and one Open System SSID.

The network runs only 802.11ac APs and uses 20 MHz channels in 2.4 GHz and 40 MHz channels in 5 GHz.

What can you do to reduce the impact of beacon frames on CCI and channel utilization?

- A. Increase the beacon interval
- B. Use the same security across all SSIDs
- **C. Disable SSID broadcasting**
- D. Use only 40 MHz channels

**Answer: C**

**NEW QUESTION # 48**

A client is operating in an unstable RF environment. Out of five data frames transmitted to the client it only receives four. The client sends a Block Ack to acknowledge the receipt of these four frames but due to frame corruption the Block Ack is not received by the AP. Which frames will be retransmitted?

- **A. All data frames**
- B. Only the Block Ack

- C. Both the corrupted data and Block Ack
- D. Only the data frame which was corrupted

**Answer: A**

Explanation:

All data frames will be retransmitted in this scenario. This is because the AP uses a Block Ack (BA) mechanism to acknowledge the receipt of multiple data frames from a client in a single frame. The BA contains a bitmap that indicates which data frames were received correctly and which were not. If the BA is not received by the AP due to frame corruption, the AP will assume that none of the data frames were received by the client and will retransmit all of them. The other options are not correct, as they do not account for the loss of the BA or the use of the bitmap.
