ISACA Certified Information Security Manager Sample Questions (Q564-Q569):

NEW QUESTION # 564

Which of the following is BEST used to determine the maturity of an information security program?

- A. Organizational risk appetite
- B. Risk assessment results
- C. Security metrics

- D. Security budget allocation

Answer: C

Explanation:

Security metrics are the best way to determine the maturity of an information security program because they are quantifiable indicators of the performance and effectiveness of the security controls and processes.

Security metrics help to evaluate the current state of security, identify gaps and weaknesses, measure progress and improvement, and communicate the value and impact of security to stakeholders. Therefore, security metrics are the correct answer.

NEW QUESTION # 565

Which of the following sources is MOST useful when planning a business-aligned information security program?

- A. Information security policy
- B. Security risk register
- C. Enterprise architecture (EA)
- **D. Business impact analysis (BIA)**

Answer: D

Explanation:

Explanation

A business-aligned information security program is one that supports the organization's business objectives and aligns the information security strategy with the business functions. A business impact analysis (BIA) is a process that identifies the critical business processes, assets, and functions of an organization, and assesses their potential impact in the event of a disruption or loss. A BIA helps to prioritize the information security requirements and controls that are needed to protect the organization's critical assets and functions from various threats and risks. Therefore, a BIA is one of the most useful sources when planning a business-aligned information security program. References = CISM Review Manual 15th Edition, page 254; CISM Review Questions, Answers & Explanations Database - 12 Month Subscription, QID 229. The most useful source when planning a business-aligned information security program is a Business Impact Analysis (BIA). A BIA is a process of identifying and evaluating the potential effects of disruptions to an organization's operations, and helps to identify the security controls and measures that should be implemented to reduce the impact of those disruptions. The BIA should include an assessment of the organization's information security posture, including its security policies, risk register, and enterprise architecture. With this information, organizations can develop an information security program that is aligned to the organization's business objectives.

NEW QUESTION # 566

Which of the following is the GREATEST security threat when an organization allows remote access to a virtual private network (VPN)?

- A. Client logins are subject to replay attack
- B. Compromised VPN clients could impact the network
- C. Attackers could compromise the VPN gateway
- **D. VPN traffic could be sniffed and captured**

Answer: D

Explanation:

Section: INFORMATION SECURITY PROGRAM MANAGEMENT

NEW QUESTION # 567

Which is the BEST method to evaluate the effectiveness of an alternate processing site when continuous uptime is required?

- A. Full interruption test

- B. Tabletop test
- **C. Parallel test**
- D. Simulation test

Answer: C

Explanation:

A parallel test is the best method to evaluate the effectiveness of an alternate processing site when continuous uptime is required. A parallel test involves processing the same transactions or data at both the primary and the alternate site simultaneously, and comparing the results for accuracy and consistency. A parallel test can validate the functionality, performance, and reliability of the alternate site without disrupting the normal operations at the primary site. A parallel test can also identify and resolve any issues or discrepancies between the two sites before a real disaster occurs. A parallel test can provide a high level of assurance and confidence that the alternate site can support the organization's continuity requirements.

References = CISM Review Manual, 16th Edition, Chapter 3: Information Security Program Development and Management, Section: Business Continuity Plan (BCP) Testing, page 1861; CISM Review Questions, Answers & Explanations Manual, 10th Edition, Question 56, page 522.

A parallel test is the best method to evaluate the effectiveness of an alternate processing site when continuous uptime is required because it involves processing data at both the primary and alternate sites simultaneously without disrupting the normal operations¹. A full interruption test would cause downtime and potential loss of data or revenue². A simulation test would not provide a realistic assessment of the alternate site's capabilities³. A tabletop test would only involve a discussion of the procedures and scenarios without actually testing the site⁴.
