Snowflake SnowPro® Core Certification (COF-C03) Sample Questions (Q211-Q216):

NEW QUESTION # 211

What takes the highest precedence in Snowflake file format options, when specified in multiple locations during data loading?

- A. The use of a copy into <table> statement
- B. The table definition
- C. The use of a copy INTO <location> statement
- D. The stage definition

Answer: A

Explanation:

When loading data into Snowflake, the file format options specified in the COPY INTO <table> statement take the highest precedence over other locations such as the stage or table definitions. This ensures that any specific settings for a particular load operation are applied correctly.

File Format Hierarchy:

Stage Definition: Specifies default file format options for files staged in the location.

Table Definition: Can specify default file format options associated with the table.

COPY INTO Statement: Overrides both the stage and table definitions with the file format options specified directly in the statement.

Example Usage:

```
COPY INTO my_table
```

```
FROM @my_stage
```

```
FILE_FORMAT = (FORMAT_NAME = 'my_format' FIELD_OPTIONALLY_ENCLOSED_BY = '');
```

NEW QUESTION # 212

What is it called when a customer managed key is combined with a Snowflake managed key to create a composite key for encryption?

- A. Key pair authentication
- B. Client-side encryption
- C. Hierarchical key model
- **D. Tri-secret secure encryption**

Answer: D

Explanation:

Tri-secret secure encryption is a security model employed by Snowflake that involves combining a customer-managed key with a Snowflake-managed key to create a composite key for encrypting data. This model enhances data security by requiring both the customer-managed key and the Snowflake-managed key to decrypt data, thus ensuring that neither party can access the data independently. It represents a balanced approach to key management, leveraging both customer control and Snowflake's managed services for robust data encryption.

NEW QUESTION # 213

Which type of join will list all rows in the specified table, even if those rows have no match in the other table?

- A. Inner join
- B. Cross join
- C. Natural join
- **D. Outer join**

Answer: D

Explanation:

An outer join, specifically a left outer join, will list all rows from the left table and match them with rows from the right table. If there is no match, the result will still include the row from the left table, with NULLs for columns from the right table. References: Based on general SQL knowledge as of 2021.

NEW QUESTION # 214

There are two Snowflake accounts in the same cloud provider region: one is production and the other is non-production. How can data be easily transferred from the production account to the non-production account?

- A. Clone the data from the production account to the non-production account.

- B. Create a reader account using the production account and link the reader account to the non-production account.
- C. Create a subscription in the production account and have it publish to the non-production account.
- **D. Create a data share from the production account to the non-production account.**

Answer: D

Explanation:

To easily transfer data from a production account to a non-production account in Snowflake within the same cloud provider region, creating a data share is the most efficient approach. Data sharing allows for live, read-only access to selected data objects from the production account to the non-production account without the need to duplicate or move the actual data. This method facilitates seamless access to the data for development, testing, or analytics purposes in the non-production environment.
