CompTIA Data+ Certification Exam Sample Questions (Q222-Q227):

NEW QUESTION # 222

How many variables are normally shown on a standard heat map?

- A. 0
- B. 1
- C. 2
- **D. 3**

Answer: D

NEW QUESTION # 223

An analyst is creating a resource to improve users' experience when they select specific records based on particular dates. Which of the following should the analyst use to create a resource that best meets user needs?

- A. Date range
- **B. Drop-down menu**
- C. Text field
- D. Frequency

Answer: B

Explanation:

Explanation

A drop-down menu is a graphical user interface element that allows users to select one option from a list of options that are hidden until the user clicks on the menu. A drop-down menu can be used to create a resource that best meets user needs when they select specific records based on particular dates, because:

A drop-down menu can provide a predefined list of dates or date ranges that are relevant and valid for the records, such as today, yesterday, last week, last month, custom range, etc. This can help users to avoid typing errors or invalid dates in a text field, and to save time and effort in entering the dates.

A drop-down menu can also provide a calendar or a date picker that allows users to select a specific date or a range of dates from a graphical representation of a calendar. This can help users to visualize and compare the dates, and to easily adjust or modify their selection.

A drop-down menu can improve the user experience by making the interface more compact and organized, as it only shows one option at a time and hides the rest of the options until the user clicks on the menu. This can help users to focus on their selection and to avoid clutter and distraction.

NEW QUESTION # 224

A business intelligence team wants to create a new dashboard in order to solve a problem statement. Which of the following is the correct order of steps the team should take?

- **A. Create a mock-up, validate the data, analyze the information, determine business needs, and find data sources.**
- B. Find data sources, determine business needs, validate the data, create a mock-up, and analyze the information.
- C. Validate the data, find data sources, analyze the information, and determine business needs.
- D. Determine business needs, find data sources, validate the data, create a mock-up, and analyze the information.

Answer: A

NEW QUESTION # 225

Encryption is a mechanism for protecting data.
When should encryption be applied to data?
Choose the best answer.

- A. When data is at rest or in transit.
- B. When data is at rest, unless you are using local storage.
- C. When data is in transit.
- D. When data is at rest.

Answer: A

Explanation:

Explanation

Correct answer B. When data is at rest or in transit.

To provide maximum protection, encrypt data both in transit and at rest.

NEW QUESTION # 226

A research analyst wants to determine whether the data being analyzed is connected to other datapoints.
Which of the following is the BEST type of analysis to conduct?

- A. Performance analysis
- B. Trend analysis
- C. Link analysis
- D. Exploratory analysis

Answer: C

Explanation:

This is because link analysis is a type of analysis that determines whether the data being analyzed is connected to other datapoints, such as entities, events, or relationships. Link analysis can be used to identify and visualize the patterns, networks, or associations among the datapoints, as well as measure the strength, direction, or frequency of the connections. For example, link analysis can be used to determine if there is a connection between a customer's purchase history and their loyalty program status. The other types of analysis are not the best types of analysis to conduct to determine whether the data being analyzed is connected to other datapoints. Here is why:

* Trend analysis is a type of analysis that determines whether the data being analyzed is changing over time, such as increasing, decreasing, or fluctuating. Trend analysis can be used to identify and visualize the patterns, cycles, or movements in the data points, as well as measure the rate, direction, or magnitude of the changes. For example, trend analysis can be used to determine if there is a change in a company's sales revenue over a period of time.

* Performance analysis is a type of analysis that determines whether the data being analyzed is meeting certain goals or objectives, such as targets, benchmarks, or standards. Performance analysis can be used to identify and visualize the gaps, deviations, or variations in the data points, as well as measure the efficiency, effectiveness, or quality of the outcomes. For example, performance analysis can be used to determine if there is a gap between a student's test score and their expected score based on their previous performance.

* Exploratory analysis is a type of analysis that determines whether there are any insights or discoveries in the data being analyzed, such as patterns, relationships, or anomalies. Exploratory analysis can be used to identify and visualize the characteristics, features, or behaviors of the data points, as well as measure their distribution, frequency, or correlation. For example, exploratory analysis can be used to determine if there are any outliers or unusual values in a dataset.
