Everyone is looking for ways to improve their ability. How can you stand out? Perhaps you can beat them in time. Our 1z0-076 exam materials don't require you to spend a lot of time learning, you can go to the 1z0-076 exam after you use them for twenty to thirty hours. This means that you can pass several exams when someone else passes an exam! Is it amazing? Yes, and only with our 1z0-076 Practice Engine, you can achieve all of these for we are the leader in this career for over ten years.

## Oracle Database 19c: Data Guard Administration Sample Questions (Q14-Q19):

### NEW QUESTION # 14

Which two are true about database roles in an Oracle Data Guard configuration?

- A. A Logical Standby Database can be converted to a Snapshot Standby Database.
- B. A Logical Standby Database can cascade redo to a terminal destination.
- C. A configuration consisting only of a primary and one or more physical standby databases can support a rolling release upgrade.
- D. A Snapshot Standby Database can be a fast-start failover target.
- E. A Physical Standby Database can be converted into a Logical Standby Database.

Answer: C,E

Explanation:

A Physical Standby Database can indeed be converted into a Logical Standby Database, providing flexibility in a Data Guard configuration. This allows for the database to switch roles and supports SQL apply operations, enabling more granular control over the data and transactions being replicated and applied. Additionally, having a configuration with a primary database and one or more physical standby databases allows for rolling upgrades to be performed. This means that each database in the Data Guard configuration can be upgraded in a phased manner, minimizing downtime and ensuring high availability during the upgrade process.

#### NEW QUESTION # 15

You are licensed to use Oracle Active Data Guard.

Which TWO statements are true after enabling block change tracking on a physical standby database?

- A. It starts the CTWR process on the primary database instance.
- B. It allows fast incremental backups to be taken on the primary database.
- C. It starts the RVWR process on the physical standby database instance.
- D. It starts the CTWR process on the physical standby database instance.
- E. It allows fast incremental backups to be offloaded to a snapshot standby database, when the physical standby database is converted.
- F. It allows fast incremental backups to be offloaded to the physical standby database.

**Answer: C,F**

Explanation:

Block change tracking is a feature that enhances the efficiency of incremental backups by recording changed blocks in a tracking file. When used with Oracle Active Data Guard:

\* It starts the RVWR process on the physical standby database instance (A): When block change tracking is enabled on a physical standby database, the Recovery Writer (RVWR) process is initiated.

This process is responsible for recording the changes to blocks in the block change tracking file, which is then used to optimize incremental backups.

\* It allows fast incremental backups to be offloaded to the physical standby database (E): With block change tracking enabled on the physical standby database, fast incremental backups can be offloaded from the primary database. This reduces the workload on the primary database and utilizes the standby database for backup operations, improving overall system performance and efficiency.

#### NEW QUESTION # 16

You have a Data Guard Broker configuration called 'Somewhere' as shown:

```
DGMGRL> SHOW CONFIGURATION;
```

Configuration - Somewhere

Protection Mode: MaxPerformance

Databases:

Nearby - Primary database

FS - Far Sync

Farout - Physical standby database

Fast-Start Failover: DISABLED

Configuration Status:

SUCCESS

You then run this command:

```
DGMGRL> SHOW DATABASE 'Nearby' 'InconsistentProperties';
```

Which two are true about the output of this DGMGRL command?

- A. It shows all properties whose broker configuration values for database Nearby are inconsistent with the values in the corresponding server parameter file or the runtime values for database instance Nearby.
- B. A far sync instance cannot have inconsistent properties because it has no database.
- C. Any inconsistency reported is on an instance-specific basis.
- D. It shows all properties whose broker configuration values for database Nearby are inconsistent with the broker configuration values for database Farout.

**Answer: A,B**

### NEW QUESTION # 17

Examine this list of possible steps:

1. Raise the compatibility level on both databases.
2. Restart SQL Apply on the upgraded logical standby database.
3. Start SQL Apply on the old primary database.
4. Perform a Switchover to the logical standby database.
5. Upgrade the logical standby database.
6. Upgrade the old primary database.

Which is the minimum number of steps in the correct order, to perform a rolling release upgrade of a data guard environment using an existing logical standby database and to enable the new functionality?

- A. 4,6,5,2,3,1
- B. 5,2,4,3,6,1
- C. 5,2,4,6,3,1
- D. 5,2,4,1
- E. 1,5,2,4,6,3

**Answer: E**

Explanation:

The process of performing a rolling release upgrade in a Data Guard environment using a logical standby database generally involves these steps:

Raise the compatibility level on both databases (1): Ensuring both the primary and logical standby databases are operating with the same and correct compatibility level is essential before starting the upgrade process.

Upgrade the logical standby database (5): Apply the database upgrade to the logical standby first, which allows the primary database to continue serving the workload without interruption.

Restart SQL Apply on the upgraded logical standby database (2): Once the logical standby has been upgraded, SQL Apply must be restarted to apply the redo data from the primary database, which is still running the earlier version.

Perform a switchover to the logical standby database (4): After confirming that the logical standby database is successfully applying redo data, perform a switchover to make it the new primary database.

Upgrade the old primary database (6): With the new primary database now in place, upgrade the old primary database (which is now the new standby) to the new Oracle Database release.

Start SQL Apply on the old primary database (3): Finally, start SQL Apply on what is now the standby database to synchronize it with the new primary database.

### NEW QUESTION # 18

Examine the Data Guard configuration:

□ What happens if you issue "switchover to sheep;" at the DGMGRL prompt?

- A. The switchover succeeds and Cats becomes the new failover target.
- B. The switchover succeeds and Fast-Start Failover is suspended.
- C. The switchover succeeds and Dogs becomes the new failover target.
- D. It results in an error indicating that a switchover is not allowed.
- E. The switchover succeeds but Dogs needs to be reinstated.

**Answer: C**

Explanation:

When issuing a "switchover to sheep;" command in a Data Guard configuration, the primary database (Dogs) transitions to a standby role, and the target standby database (Sheep) becomes the new primary database.

Fast-Start Failover (FSFO) remains enabled, but its target changes according to the new roles of the databases.

Since Cats is also a physical standby database, it does not become the failover target by default unless it is specified in the broker configuration. After the switchover, the original primary (Dogs) becomes the new standby database and thus the new failover target for FSFO. References: Oracle Data Guard Broker documentation provides detailed procedures and explanations of switchover

operations, including how FSFO targets are affected post-switchover. This behavior is consistent across different Oracle Database versions that support Data Guard and FSFO.
