NEW QUESTION # 325

Just when you thought you knew every possible storage option on AWS you hear someone mention Reduced Redundancy Storage (RRS) within Amazon S3. What is the ideal scenario to use Reduced Redundancy Storage (RRS)?

- A. Huge volumes of data
- **B. Non-critical or reproducible data**
- C. Sensitive data
- D. Critical data

Answer: B

Explanation:

Reduced Redundancy Storage (RRS) is a new storage option within Amazon S3 that enables customers to reduce their costs by storing non-critical, reproducible data at lower levels of redundancy than Amazon S3's standard storage. RRS provides a lower cost, less durable, highly available storage option that is designed to sustain the loss of data in a single facility.

RRS is ideal for non-critical or reproducible data.

For example, RRS is a cost-effective solution for sharing media content that is durably stored elsewhere.

RRS also makes sense if you are storing thumbnails and other resized images that can be easily reproduced from an original image.

NEW QUESTION # 326

A company has an application that ingests incoming messages. These messages are then quickly consumed by dozens of other applications and microservices.

The number of messages varies drastically and sometimes spikes as high as 100,000 each second. The company wants to decouple the solution and increase scalability.

Which solution meets these requirements?

- **A. Publish the messages to an Amazon Simple Notification Service (Amazon SNS) topic with one or more Amazon Simple Queue Service (Amazon SQS) subscriptions. All applications then process the messages from the queues.**
- B. Persist the messages to Amazon Kinesis Data Analytics. All the applications will read and process the messages.
- C. Deploy the application on Amazon EC2 instances in an Auto Scaling group, which scales the number of EC2 instances based on CPU metrics.
- D. Write the messages to Amazon Kinesis Data Streams with a single shard. All applications will read from the stream and process the messages.

Answer: A

Explanation:

By routing incoming requests to Amazon SQS, the company can decouple the job requests from the processing instances. This allows them to scale the number of instances based on the size of the queue, providing more resources when needed. Additionally, using an Auto Scaling group based on the queue size will automatically scale the number of instances up or down depending on the workload. Updating the software to read from the queue will allow it to process the job requests in a more efficient manner, improving the performance of the system.

NEW QUESTION # 327

A company needs to deploy services to an AWS region which they have not previously used. The company currently has an AWS identity and Access Management (IAM) role for the Amazon EC2 instances, which permits the instance to have access to Amazon DynamoDB. The company wants their EC2 instances in the new region to have the same privileges. How should the company achieve this?

- A. Copy the IAM role and associated policies to the new region and attach it to the instances
- B. Create an Amazon Machine Image (AMI) of the instance and copy it to the desired region using the AMI Copy feature
- C. Create a new IAM role and associated policies within the new region
- D. Assign the existing IAM role to the Amazon EC2 instances in the new region

Answer: A

NEW QUESTION # 328

A company wants to create a mobile app that allows users to stream slow-motion video clips on their mobile devices. Currently, the app captures video clips and uploads the video clips in raw format into an Amazon S3 bucket. The app retrieves these video clips directly from the S3 bucket. However, the videos are large in their raw format. Users are experiencing issues with buffering and playback on mobile devices. The company wants to implement solutions to maximize the performance and scalability of the app while minimizing operational overhead. Which combination of solutions will meet these requirements? (Select TWO.)

- A. Use AWS DataSync to replicate the video files across AWS Regions in other S3 buckets
- B. Use Amazon Elastic Transcoder to convert the video files to more appropriate formats
- C. Deploy Amazon CloudFront for content delivery and caching
- D. Deploy an Auto Scaling group of Amazon EC2 instances to convert the video files to more appropriate formats
- E. Deploy an Auto Scaling group of Amazon EC2 instances in Local Zones for content delivery and caching

Answer: B,E

NEW QUESTION # 329

A company runs a web service on Amazon EC2 instances behind an Application Load Balancer. The instances run in an Amazon EC2 Auto Scaling group across two Availability Zones. The company needs a minimum of four instances at all times to meet the required service level agreement (SLA) while keeping costs low. If an Availability Zone fails, how can the company remain compliant with the SLA?

- A. Change the Auto Scaling group to use eight servers across two Availability Zones
- B. Change the Auto Scaling group launch configuration to use a larger instance type
- C. Change the Auto Scaling group to use six servers across three Availability Zones
- D. Add a target tracking scaling policy with a short cooldown period

Answer: D
