UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q55-Q60):

NEW QUESTION # 55
Which role is responsible for overseeing access needs for Studio and Orchestrator during technical validation?

- A. Solution Architect
- B. Project Manager
- C. Automation Developer
- D. Infrastructure Engineer

Answer: A

Explanation:
The Solution Architect is responsible for overseeing access requirements for UiPath tools such as Studio and Orchestrator during the Business Case and Technical Validation stage. They identify what access the developers, robots, and other roles will require to successfully design, develop, and run automations.
This includes determining:

* Application credentials needed for bots
* Role-based access for developers
* Orchestrator permissions for robot scheduling and asset use
* Environment setup and connectivity

Ensuring access is defined early prevents blockers during development and testing. The Solution Architect collaborates with theInfrastructure EngineerandClient IT Teamto secure and document these requirements.

NEW QUESTION # 56

Which stage of the Automation Implementation Methodology involves assessing automation candidates for business value and technical feasibility?

- **A. Business Case and Technical Validation**
- B. Kickoff
- C. Process Analysis
- D. Deployment and Hypercare

Answer: A

Explanation:

TheBusiness Case and Technical Validationstage is crucial for evaluatingwhether an automation initiative is feasible and valuable. In this stage, selected automation candidates undergo rigorous assessment to determine if they are suitable for automation in terms of business impact and technical execution.

Key stakeholders involved include thebusiness analyst,solution architect, andproject manager. The business analyst evaluates theROI and cost-benefitof automating the process. Simultaneously, the solution architect assesses thetechnical complexity,dependencies, andaccess requirementsfor implementation.

This dual validation ensures the process is worth automating and can be implemented within the current technical environment. Processes that are highly complex, have low ROI, or involve systems that do not integrate well may be deprioritized or dropped. Without this stage, organizations risk spending time and resources on automations that may not deliver sufficient value or may face technical hurdles, which is why it is a foundational step in the implementation methodology.

NEW QUESTION # 57

What is the final step the business analyst must take to complete the Process Design Document?

- A. Create the test case scenarios.
- **B. Validate the document with both the business owner and the development team.**
- C. Describe the As Is and the To Be.
- D. Get sign-off from the process owner.

Answer: B

Explanation:

Thefinal stepin completing theProcess Design Document (PDD)is tovalidate the document with both the business owner and the development team. Although describing the As-Is and To-Be processes, drafting workflows, and collecting inputs are fundamental steps, none of these finalize the document without validation.

Validation ensures that the PDD isaccurate, complete, and alignedwith both business expectations and technical feasibility. From the business side, the process owner confirms that the documented workflows correctly reflect the real operations, business rules, exceptions, and desired outcomes. From the technical side, the development team verifies that the documented To-Be process is feasible for automation, aligns with UiPath capabilities, and contains the level of detail needed for solution design.

The validation step is crucial because the PDD becomes the foundation for solution design, development, test planning, and success criteria definition. Without this mutual agreement, automation may fail to meet expectations, result in rework, or lead to misaligned business and technical interpretations. Proper validation ensures project success and prevents downstream issues.

NEW QUESTION # 58

Which document is used to define how UAT will be conducted and by whom?

- A. Access Control Matrix
- B. Project Charter

- C. User Acceptance Testing (UAT) Plan
- D. Solution Design Document

Answer: C

Explanation:
TheUser Acceptance Testing (UAT) Planis the document that defineshow UAT will be conducted,who will participate, whattest scenarioswill be used, and what constitutessuccess.
This plan typically includes:
* Roles and responsibilities during testing
* UAT schedule and timelines
* Test data and environment setup
* Test cases and expected outcomes
* Defect management and resolution protocol
The UAT Plan ensures astructured and coordinated approachto acceptance testing. It is typically prepared by theBusiness AnalystandProject Manager, and is reviewed by both the Implementation and Client Teams to ensure alignment before testing begins.

NEW QUESTION # 59
Which of the following best describes how automation software robots operate?

- A. They physically interact with machines to perform tasks.
- B. They write code autonomously.
- C. They require constant human supervision.
- D. They mimic human actions to interact with digital systems and applications.

Answer: D

Explanation:
Automation software robots, particularly those built using UiPath, operate bymimicking human actionsto interact with digital systems and applications. This includes actions such as clicking buttons, typing into fields, reading data from screens, extracting information from documents, navigating applications, and triggering system events. Their behavior is defined through automation workflows created by developers using tools like UiPath Studio.
These robots do not require constant supervision; unattended robots operate autonomously, while attended robots are triggered by users. They also do not interact physically with machines. Instead, they work entirely within virtual environments, desktops, and applications.
By replicating human behavior in digital workflows, robots can perform repetitive, rule-based tasks consistently, quickly, and without fatigue. This enables organizations to improve operational efficiency, reduce human error, increase accuracy, and free employees to focus on more strategic work.
Software robots do not write code on their own-developers design their workflows. However, with AI enhancements, they can assist in automation development. Still, their core functionality relies on executing predefined instructions that simulate human interaction with digital systems.
