Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q18-Q23):

NEW QUESTION # 18

An administrator wants to check the size, availability, and usage of all pools in the cluster. Which command should the administrator use?

- A. `pxctl service pool show`
- B. `kubectl get storagecluster`
- C. `pxctl cluster provision-status`

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To view detailed information about storage pools in a Portworx cluster-including size, availability, usage, and health-administrators should use the command `pxctl service pool show`. This CLI command provides a comprehensive overview of all storage pools configured on cluster nodes, including pool IDs, device names, pool sizes, free space, and status. It helps administrators monitor resource utilization, detect degraded pools, and plan capacity expansions. While `kubectl get storagecluster` shows the overall cluster CRD status and `pxctl cluster provision-status` shows provisioning status, neither provides detailed pool-level insights. Portworx's operational documentation recommends `pxctl service pool show` as the definitive command for monitoring pool resources and ensuring storage health across the cluster **【Pure Storage Portworx CLI Guide source】**.

NEW QUESTION # 19

An infrastructure admin wants to restrict installing Portworx on two nodes. What label does the node need to have?

- A. `px/enabled=false`
- B. `px/service=stop`
- C. `px/storage-node=false`

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Portworx uses node labeling as a mechanism to control on which Kubernetes nodes Portworx is installed and allowed to operate.

To restrict Portworx installation on specific nodes, those nodes should be labeled with `px/enabled=false`. This label tells the Portworx Operator or installation scripts to exclude these nodes from Portworx deployment, preventing Portworx daemons from running there. This feature is useful for reserving nodes for non-storage workloads or avoiding unsupported hardware. Labels like `px/service=stop` or `px/storage-node=false` are not recognized by Portworx as controls for installation exclusion. The official Portworx deployment and node labeling documentation specify `px/enabled=false` as the standard method for controlling node participation in the storage cluster, offering administrators fine-grained control over cluster topology and resource allocation [【 Pure Storage Portworx Deployment Guide source 】](#) .

NEW QUESTION # 20

What is the minimum Stork version required to perform an Application Backup?

- A. Stork 2.3
- B. Stork 23.3.0
- C. Any Stork version works

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Stork version 2.3 is the minimum version required to support Application Backup features in Portworx. Application Backup allows for consistent snapshots and restores of complex, multi-volume, and multi-pod stateful applications. This capability depends on enhancements introduced in Stork 2.3 that enable application-aware backup orchestration, coordination between Kubernetes and storage layers, and integration with backup policies. Earlier Stork versions lack these features, making them unsuitable for application-level backups. Portworx release notes and Stork documentation confirm that version 2.3 introduced key functionalities that underpin the reliable backup and restore workflows for stateful workloads, making it a baseline requirement for disaster recovery and business continuity implementations involving application backups [【 Pure Storage Portworx Backup Docs source 】](#) .

NEW QUESTION # 21

What option can a Portworx administrator use to perform snapshots of Repl 2 or 3 volumes when there is limited space on the cluster and no Object Store is configured?

- A. Cloud Snapshot
- B. Local Snapshot
- C. Skinny Snapshot

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Skinny Snapshots are a space-efficient snapshot technique used by Portworx for replicated volumes (Repl 2 or 3) when storage capacity is limited and no external Object Store is configured. Unlike full snapshots that duplicate data blocks, skinny snapshots capture only the differences (deltas) since the last snapshot, minimizing space consumption. This method allows administrators to take frequent snapshots without significantly impacting storage availability. Skinny Snapshots are particularly useful for on-premises environments or clusters without access to cloud object storage, balancing snapshot granularity with resource constraints. Official Portworx snapshot documentation explains how skinny snapshots work internally, improving backup and recovery capabilities under tight storage conditions without requiring cloud integration [【 Pure Storage Portworx Snapshot Guide source 】](#) .
