## ISTQB (ISTQB CTAL-TA) ISTQB Certified Tester Advanced Level - Test Analyst (Syllabus 2012) Sample Questions (Q48-Q53):

NEW QUESTION # 48

What is the MOST important reason why test conditions should be understandable by business stakeholders?

- A. They should be able to review the test conditions and provide feedback to the Test Analyst
- B. They should be able to use them to establish traceability to requirements
- C. They should be able to use them as a basis for designing test cases.
- D. Test documentation should always be understandable by all stakeholders.

**Answer: A**

Explanation:

The most important reason why test conditions should be understandable by business stakeholders is that they should be able to review them and provide feedback to the Test Analyst, as they are the ones who know the business needs and expectations best. This way, the Test Analyst can ensure that the test conditions cover all the relevant aspects of the test basis and are aligned with the business objectives. The other reasons are not as important or not directly related to test conditions. Verified References: ISTQB Certified Tester Advanced Level Test Analyst CTAL-TA, Section 2.2.1, page 21.

#### NEW QUESTION # 49

Which task is considered the responsibility of the Test Analyst and ONLY performed as part of the test implementation activities?  
SELECT ONE OPTION

- A. Designing the test environment and identifying any required infrastructure, including tools
- B. Capturing bi-directional traceability between the test basis, test conditions, and test cases
- C. Identifying test data to support test conditions and test cases
- D. Creating a test execution schedule, including resource allocation

**Answer: C**

Explanation:

Comprehensive and Detailed in Depth Explanation:

\* During test implementation, the Test Analyst's primary task is to identify and prepare test data that supports the execution of test cases and conditions.

\* B. Creating a test execution schedule is part of test planning, not implementation.

\* C. Capturing bi-directional traceability typically occurs during test design and management activities, not exclusively during implementation.

\* D. Designing the test environment is typically a Technical Test Analyst responsibility, as it involves infrastructure and tool setups. The correct answer is A (Identifying test data to support test conditions and test cases).

#### NEW QUESTION # 50

Rather than developing an e-commerce product, management has decided to acquire a COTS package. The e-commerce product needs to interface

with backend applications such as finance, stock control and order delivery. You are asked to define a test plan for this project.

Given just the information in the scenario, which of the following software quality characteristics must be included in your test plan?

- A. Reliability
- B. Maintainability
- C. Portability
- D. Interoperability

**Answer: D**

Explanation:

The software quality characteristic that must be included in the test plan for this project is interoperability.

Interoperability is a software quality characteristic that evaluates the degree to which two or more systems or components can exchange information and use the information that has been exchanged. This characteristic is relevant for a project that involves acquiring a COTS package that needs to interface with backend applications such as finance, stock control, and order delivery.

#### NEW QUESTION # 51

For an ATM banking project the following applies: "When the user first inserts a valid credit card, the system considers the user to be in an unauthenticated state. When requesting a cash advance, the user must be in an authenticated state. The user authenticates by entering the correct PIN code for the card they have used.

During the user authentication, the system shall allow the user to enter their PIN code up to three times before failing the authentication and rejecting the card. On the first and second try, the system shall prompt the user to re-enter the PIN code " Suppose you are concerned that, depending on the number of invalid PIN codes entered, the system may behave incorrectly. Which of the following test design techniques is specifically targeted at finding such failures?

- **A. State transition testing using 1-switch coverage**
- B. Equivalence partitioning
- C. Pairwise testing
- D. Classification tree technique

**Answer: A**

Explanation:

The test design technique that is specifically targeted at finding failures depending on the number of invalid PIN codes entered is state transition testing using 1-switch coverage. State transition testing is a technique that tests the behavior of a system or component based on its states and transitions between them. A 1-switch test case is a test case that covers two states and the transition between them. This technique can test how the system reacts to different sequences of events and how it handles invalid inputs. Verified

#### **NEW QUESTION # 52**

A web-based system is being developed to support the administration of tennis tournaments.

The system provides advice on how much money to offer each player as their individual attendance fee. The amount depends on a combination of the following factors:

- \* Overall attendance fund (divided into five numeric ranges)
- \* Player's current world ranking (divided into ten numeric ranges)
- \* Whether it is a local tournament for the player (YES or NO)
- \* Their relationship with the tournament sponsors (clothing, equipment, or endorsement)
- \* Their previous attendance history at this event (finalist, played, withdrew before event, or withdrew during event) The new system needs to be ready for the next tournament in just a few months' time, so testing schedules will be severely challenged.

Which specification-based technique would be the BEST choice in the circumstances?

SELECT ONE OPTION:

- A. Use case testing
- **B. Pairwise testing**
- C. Equivalence partitioning
- D. State Transition testing

**Answer: B**

Explanation:

Comprehensive and Detailed In-Depth Explanation:

- \* A (Use case testing): Not suitable as it focuses on user interactions rather than combinations of input values.
  - \* B (State Transition testing): Irrelevant since the focus is not on state changes.
  - \* C (Equivalence partitioning): Good for partitioning input values but not efficient for combinations.
  - \* D (Pairwise testing): Correct. This technique is highly efficient for covering combinations of multiple variables with fewer test cases, which is crucial when the schedule is tight.
- Therefore, the correct answer is D (Pairwise testing).
