ISQI ISTQB Certified Tester-Foundation Level - Usability Testing Sample Questions (Q16-Q21):

NEW QUESTION # 16

You are asked to evaluate the usability of a software application for a law firm. Due to time and budget constraints, it is not possible to include users in the evaluation process.

Which of the following is a valid approach for evaluating the usability in this case?

- A. User surveys
- B. Usability testing
- C. Accessibility Evaluation
- **D. Usability Review**

Answer: D

Explanation:

When actual users cannot be included, a usability review (often an expert or heuristic evaluation) is the most practical method. Trained evaluators examine the interface against usability principles and standards to identify potential issues. Surveys require user input, and usability testing cannot proceed without users.

Accessibility evaluation targets inclusivity for users with impairments, which is related but not a substitute for overall usability evaluation. Therefore, option A is the only valid method under these constraints.

NEW QUESTION # 17

What is the System Usability Scale (SUS)?

- **A. A simple, ten-item attitude scale giving a global view of subjective assessments of usability.**
- B. A usability test execution activity specified by the moderator that needs to be accomplished by a usability test participant within a given period of time.
- C. Testing to evaluate the degree to which the system can be used by specified users with effectiveness, efficiency and satisfaction in a specified context of use.
- D. A requirement on the usability of a component of system

Answer: A

Explanation:

The System Usability Scale (SUS) is a standardized, reliable tool used to measure perceived usability. It consists of 10 items with five response options (from strongly agree to strongly disagree). It is widely used due to its simplicity and effectiveness in providing a single score to reflect a user's overall satisfaction with a system. Option A refers to ISO's definition of usability testing, B describes a task in usability testing, and D refers to a usability requirement, not SUS. Therefore, the correct description of SUS is option C.

NEW QUESTION # 18

Which of the following statements about usability test scripts is wrong?

- A. It contains pre-session interview questions.
- B. It contains post-session interview questions.
- C. It is a checklist used by the moderator of a usability test.
- **D. It contains answers to the test questions.**

Answer: D

Explanation:

A usability test script is a structured document used by the moderator to ensure consistency across test sessions. It typically includes pre-session briefing text, pre- and post-session interview questions, and the specific usability tasks to be performed. However, it does not include answers to the test questions, as usability tests focus on observing user behavior and performance-not testing users' knowledge. Providing answers would bias results and invalidate findings. Thus, option D is incorrect and the best choice.

#####

NEW QUESTION # 19

In the last project, the usability tests substantially exceeded the budget of the test plan. Which quality control task could have been used to avoid this?

- A. Check that findings are communicated to the stakeholders
- B. Check that the usability test plan has been properly reviewed
- **C. Check consumed resources regularly and compare with the estimates**
- D. Check whether the usability test report conforms to the best practices

Answer: C

Explanation:

To prevent usability testing from exceeding budget, active monitoring and control of project resources are critical. The best practice is to regularly check consumed time, costs, and effort against the original estimates, allowing timely adjustments to scope or resources. This is a classic quality control practice aligned with ISO 9001 principles and standard project management methodologies. Option A relates to test preparation, option C concerns reporting and communication, and option D applies after test execution. Only option B deals directly with budget control during the test.

#####

NEW QUESTION # 20

You're redesigning the web shop of a customer and found out that they are using legacy web design techniques like HTML tables for design matters, making the website hard to be operated using alternative input and output devices (e.g. screen readers).

Which kind of risk is most likely to occur?

- A. There's no risk predictable
- **B. Accessibility risk**
- C. Usability risk
- D. User experience risk

Answer: B

Explanation:

The use of HTML tables for layout instead of proper semantic HTML and responsive design violates accessibility guidelines, particularly those defined in the Web Content Accessibility Guidelines (WCAG).

Such a design makes it difficult or impossible for users relying on screen readers, keyboard navigation, or other assistive technologies

to interact effectively with the site. Therefore, this creates a significant accessibility risk, which is distinct from general usability or user experience risks. Accessibility ensures inclusion of users with physical or cognitive impairments, making option B the correct choice. References:
