NEW QUESTION # 62
What describes an RPO?

- A. To confirm at what point a backup should be migrated to Object Storage
- B. To clarify how many restore points need to be recovered at the same time
- C. To confirm the data loss tolerance of a Business Unit or Organization
- D. To determine the maximum length of time a workload or application can be down

Answer: C

Explanation:
Recovery Point Objective (RPO) refers to the maximum acceptable amount of data loss measured in time. It is essentially the age of the files that must be recovered from backup storage for normal operations to resume after a failure or disaster. In other words, it defines the data loss tolerance of a business unit or organization. If an RPO is set to one hour, the system must back up at least every hour to meet the RPO.

NEW QUESTION # 63
An administrator is asked to change a backup copy job from periodic mode to immediate mode.
How can this be accomplished?

- A. Right click on the job name and choose immediate.
- B. Enable immediate in the backup copy job settings drop down.
- C. Copy the original backup copy job to a different folder and remap the job.
- D. Create a new backup copy job and delete the original job.

Answer: B

NEW QUESTION # 64

An engineer is using Veeam Backup and Replication v12. The only backup repository is a Microsoft Windows server with direct attached Fibre Channel storage array.

The engineer realizes that none of their backups are immutable. A second copy of the backup on a different site and a different media is required.

Which option should be used to provide immutable backups on a secondary site with a different media?

- A. Create a new hardened repository on a new Microsoft Windows Server, mark it as immutable and create a backup copy job on it.
- B. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and AWS S3 bucket with immutability enabled as the capacity tier.
- C. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and Google Cloud Object Storage with immutability enabled as the capacity tier.
- D. Create a Scale Out Backup Repository with the existing Microsoft Windows Server as the performance tier and an HPe StoreOnce Catalyst share with immutability enabled as the capacity tier.

Answer: B

Explanation:

To provide immutable backups on a secondary site with a different media, the best option given the context is B: Create a Scale Out Backup Repository (SOBR) with the existing Microsoft Windows Server as the performance tier and an AWS S3 bucket with immutability enabled as the capacity tier. This approach involves leveraging the existing backup infrastructure (Microsoft Windows Server with direct-attached storage) as the performance tier of the SOBR, where the most recent backups are stored for fast access. For long-term storage and immutability, backups can be offloaded to an AWS S3 bucket configured with Object Lock. The Object Lock feature in AWS S3 provides an additional layer of data protection by making the backup data immutable, meaning it cannot be deleted or modified for a specified duration. This setup ensures that backup data is protected against accidental deletion, ransomware, and other malicious activities.

By implementing this configuration, the engineer can achieve the desired level of data protection and immutability, utilizing cloud storage as a secure and scalable secondary backup location, distinct from the primary on-premises storage media.

NEW QUESTION # 65

A physical Linux server protected by a centrally managed Veeam agent is physically damaged. A VMware vSphere infrastructure is available, and the physical server is eligible for virtualization.

Which recovery step provides the lowest possible RTO?

- A. Use Instant VM Recovery to VMware
- B. Use Bare Metal Restore to VMware vSphere VM.
- C. Use Instant Disk Recovery to VMware vSphere.
- D. Use Export Disk Content as Virtual Disk to create a new VM.

Answer: A

Explanation:

Instant VM Recovery to VMware offers the lowest possible RTO for restoring a physically damaged Linux server to a VMware vSphere infrastructure. This feature rapidly restores service by running the server directly from the backup file in a VMware environment.
