Reliable SAA-C03 Test Cram, Exam Questions SAA-C03 Vce

Our company provides three different versions to choice for our customers. The software version of our SAA-C03 exam question has a special function that this version can simulate test-taking conditions for customers. If you feel very nervous about exam, we think it is very necessary for you to use the software version of our SAA-C03 guide torrent. The simulated tests are similar to recent actual exams in question types and degree of difficulty. By simulating actual test-taking conditions, we believe that you will relieve your nervousness before examination. So hurry to buy our SAA-C03 Test Questions, it will be very helpful for you to pass your exam and get your certification.

To pass the Amazon SAA-C03 Exam, candidates need to demonstrate their ability to design and deploy secure, efficient, and cost-effective AWS solutions based on customer requirements. SAA-C03 exam consists of 65 multiple-choice and multiple-response questions that need to be completed within 130 minutes. The passing score for the SAA-C03 exam is 720 out of 1000 points. Candidates who pass the exam will earn the Amazon AWS Certified Solutions Architect - Associate certification, which is recognized globally and demonstrates their expertise in designing and deploying AWS solutions. AWS Certified Solutions Architect - Associate certification is essential for professionals who want to advance their career in cloud computing and work with AWS-based solutions for their organizations.

Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q104-Q109):

NEW QUESTION # 104

A company that primarily runs its application servers on premises has decided to migrate to AWS. The company wants to minimize its need to scale its Internet Small Computer Systems Interface (iSCSI) storage on premises. The company wants only its recently accessed data to remain stored locally.

Which AWS solution should the company use to meet these requirements?

- A. AWS Storage Gateway Tape Gateway
- B. Amazon S3 File Gateway
- **C. AWS Storage Gateway Volume Gateway cache volumes**
- D. AWS Storage Gateway Volume Gateway stored volumes

Answer: C

Explanation:

Explanation

AWS Storage Gateway Volume Gateway provides two configurations for connecting to iSCSI storage, namely, stored volumes and cached volumes. The stored volume configuration stores the entire data set on-premises and asynchronously backs up the data to AWS. The cached volume configuration stores recently accessed data on-premises, and the remaining data is stored in Amazon S3. Since the company wants only its recently accessed data to remain stored locally, the cached volume configuration would be the most appropriate. It allows the company to keep frequently accessed data on-premises and reduce the need for scaling its iSCSI storage while still providing access to all data through the AWS cloud. This configuration also provides low-latency access to frequently accessed data and cost-effective off-site backups for less frequently accessed data.

NEW QUESTION # 105

A construction company has an online system that tracks all of the status and progress of their projects. The system is hosted in AWS and there is a requirement to monitor the read and write IOPs metrics for their MySQL RDS instance and send real-time alerts to their DevOps team.

Which of the following services in AWS can you use to meet the requirements? (Select TWO.)

- A. SWF
- B. Amazon Simple Queue Service
- **C. CloudWatch**
- D. Route 53
- **E. Amazon Simple Notification Service**

Answer: C,E

Explanation:

In this scenario, you can use CloudWatch to monitor your AWS resources and SNS to provide notification. Hence, the correct answers are CloudWatch and Amazon Simple Notification Service.

Amazon Simple Notification Service (SNS) is a flexible, fully managed pub/sub messaging and mobile notifications service for coordinating the delivery of messages to subscribing endpoints and clients.

Amazon CloudWatch is a monitoring service for AWS cloud resources and the applications you run on AWS. You can use Amazon CloudWatch to collect and track metrics, collect and monitor log files, set alarms, and automatically react to changes in your AWS resources.

SWF is incorrect because this is mainly used for managing workflows and not for monitoring and notifications.

Amazon Simple Queue Service is incorrect because this is a messaging queue service and not suitable for this kind of scenario.

Route 53 is incorrect because this is primarily used for routing and domain name registration and management.

NEW QUESTION # 106

A company hosts its web applications in the AWS Cloud. The company configures Elastic Load Balancers to use certificates that are imported into AWS Certificate Manager (ACM). The company's security team must be notified 30 days before the expiration of each certificate.

What should a solutions architect recommend to meet the requirement?

- A. Use AWS Trusted Advisor to check for certificates that will expire within 30 days. Create an Amazon CloudWatch alarm that is based on Trusted Advisor metrics for check status changes. Configure the alarm to send a custom alert by way of Amazon Simple Notification Service (Amazon SNS).
- **B. Create an AWS Config rule that checks for certificates that will expire within 30 days. Configure Amazon EventBridge (Amazon CloudWatch Events) to invoke a custom alert by way of Amazon Simple Notification Service (Amazon SNS) when AWS Config reports a noncompliant resource.**
- C. Create an Amazon EventBridge (Amazon CloudWatch Events) rule to detect any certificates that will expire within 30 days. Configure the rule to invoke an AWS Lambda function. Configure the Lambda function to send a custom alert by way of Amazon Simple Notification Service (Amazon SNS).
- D. Add a rule in ACM to publish a custom message to an Amazon Simple Notification Service (Amazon SNS) topic every day beginning 30 days before any certificate will expire.

Answer: B

Explanation:

NEW QUESTION # 107

A company's application integrates with multiple software-as-a-service (SaaS) sources for data collection. The company runs Amazon EC2 instances to receive the data and to upload the data to an Amazon S3 bucket for analysis. The same EC2 instance that receives and uploads the data also sends a notification to the user when an upload is complete. The company has noticed slow application performance and wants to improve the performance as much as possible.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Create an Auto Scaling group so that EC2 instances can scale out. Configure an S3 event notification to send events to an Amazon Simple Notification Service (Amazon SNS) topic when the upload to the S3 bucket is complete.
- B. Create a Docker container to use instead of an EC2 instance. Host the containerized application on Amazon Elastic Container Service (Amazon ECS). Configure Amazon CloudWatch Container Insights to send events to an Amazon Simple Notification Service (Amazon SNS) topic when the upload to the S3 bucket is complete.
- C. Create an Amazon EventBridge (Amazon CloudWatch Events) rule for each SaaS source to send output data. Configure the S3 bucket as the rule's target. Create a second EventBridge (CloudWatch Events) rule to send events when the upload to the S3 bucket is complete. Configure an Amazon Simple Notification Service (Amazon SNS) topic as the second rule's target.
- **D. Create an Amazon AppFlow flow to transfer data between each SaaS source and the S3 bucket. Configure an S3 event notification to send events to an Amazon Simple Notification Service (Amazon SNS) topic when the upload to the S3 bucket is complete.**

Answer: D

Explanation:

Explanation

Amazon AppFlow is a fully managed integration service that enables you to securely transfer data between Software-as-a-Service (SaaS) applications like Salesforce, SAP, Zendesk, Slack, and ServiceNow, and AWS services like Amazon S3 and Amazon Redshift, in just a few clicks. <https://aws.amazon.com/appflow/>

NEW QUESTION # 108

A company is running a publicly accessible serverless application that uses Amazon API Gateway and AWS Lambda. The application's traffic recently spiked due to fraudulent requests from botnets.

Which steps should a solutions architect take to block requests from unauthorized users? (Select TWO.)

- A. Integrate logic within the Lambda function to ignore the requests from fraudulent IP addresses.
- B. Convert the existing public API to a private API. Update the DNS records to redirect users to the new API endpoint.
- **C. Implement an AWS WAF rule to target malicious requests and trigger actions to filter them out.**
- D. Create an IAM role for each user attempting to access the API. A user will assume the role when making the API call.
- **E. Create a usage plan with an API key that is shared with genuine users only.**

Answer: C,E

Explanation:

<https://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-api-usage-plans.html#:~:text=Don%20https://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-api-usage-plans.html>
