

# Guide Google Associate-Cloud-Engineer Torrent - Training Associate-Cloud-Engineer Online

P.S. Free 2026 Google Associate-Cloud-Engineer dumps are available on Google Drive shared by Exam4Tests:  
[https://drive.google.com/open?id=1HlunC2q6GjE5Ia0CzMP6v-I\\_qDnGcZpR](https://drive.google.com/open?id=1HlunC2q6GjE5Ia0CzMP6v-I_qDnGcZpR)

Perhaps you agree that strength is very important, but there are doubts about whether our Associate-Cloud-Engineer study questions can really improve your strength. It does not matter, we can provide you with a free trial version of our Associate-Cloud-Engineer exam braindumps. You can free download the demos of our Associate-Cloud-Engineer learning prep easily on our website, and there are three versions according to the three versions of our Associate-Cloud-Engineer practice engine. It is really as good as we say, you can experience it yourself.

The Google Associate Cloud Engineer Exam certification exam is designed to provide candidates with a comprehensive understanding of Google Cloud technologies and their applications. It is an excellent way for candidates to demonstrate their proficiency in cloud computing and gain recognition for their expertise. Google Cloud technologies are rapidly growing in popularity, and the demand for skilled professionals who can manage and deploy cloud solutions is increasing.

## Training Associate-Cloud-Engineer Online, Associate-Cloud-Engineer Valid Braindumps Questions

Different from the common question bank on the market, Associate-Cloud-Engineer actual exam are scientific and efficient learning system for a variety of professional knowledge that is recognized by many industry experts. We have carried out the reforms according to the development of the digital devices not only on the content of our Associate-Cloud-Engineer Exam Torrent, but also on the layouts since we provide the latest and precise information to our customers, so there is no doubt you will pass the Associate-Cloud-Engineer exam with our latest Associate-Cloud-Engineer exam questions.

## Preparation Process

The candidates for the Google Associate Cloud Engineer certification exam have a variety of preparation options to choose from. Everything that the applicants need to prepare for the qualifying test can be found on the official website. For starters, the learners are recommended to purchase the Official Google Cloud Certified Associate Cloud Engineer Study Guide published by Wiley to get a comprehensive understanding of the topics included in the exam syllabus. The official platform also offers such valuable training tools as sample questions, Cloud Engineer learning path, and webinars guided by the certified experts. Moreover, the individuals can sign up for the Preparing for the Associate Cloud Engineer Examination course to do a final check for the exam readiness. Lastly, they can take advantage of Google Cloud documentation, which contains a great collection of tutorials, guides, and other resources on Google Cloud products.

To earn the Google Associate-Cloud-Engineer Certification, candidates need to have a good understanding of the GCP infrastructure, networking, and storage services. They should also have experience in deploying and managing applications on GCP. Google Associate Cloud Engineer Exam certification exam consists of multiple-choice questions and practical scenarios that test the candidate's knowledge and skills in these areas.

## Google Associate Cloud Engineer Exam Sample Questions (Q279-Q284):

### NEW QUESTION # 279

You are the team lead of a group of 10 developers. You provided each developer with an individual Google Cloud Project that they can use as their personal sandbox to experiment with different Google Cloud solutions.

You want to be notified if any of the developers are spending above \$500 per month on their sandbox environment. What should you do?

- A. Create a single billing account for all sandbox projects and enable BigQuery billing exports. Create a Data Studio dashboard to plot the spending per project.
- B. Create a single budget for all projects and configure budget alerts on this budget.
- C. Create a budget per project and configure budget alerts on all of these budgets.
- D. Create a separate billing account per sandbox project and enable BigQuery billing exports. Create a Data Studio dashboard to plot the spending per billing account.

**Answer: C**

Explanation:

Explanation/Reference: <https://cloud.google.com/billing/docs/how-to/budgets>

### NEW QUESTION # 280

You created a Google Cloud Platform project with an App Engine application inside the project. You initially configured the application to be served from the us-central region. Now you want the application to be served from the asia-northeast1 region. What should you do?

- A. Change the region property setting in the existing App Engine application from us-central to asia-northeast1.
- B. Create a second App Engine application in the existing GCP project and specify asia-northeast1 as the region to serve your application.
- C. Create a new GCP project and create an App Engine application inside this new project. Specify asia-northeast1 as the region to serve your application.
- D. Change the default region property setting in the existing GCP project to asia-northeast1.

**Answer: C**

Explanation:

<https://cloud.google.com/appengine/docs/flexible/managing-projects-apps-billing#:~:text=Each%20Cloud%20project%20can%20contain%20only%20a%20single%20App%20Engine%20application%2C%20and%20once%20created%20you%20cannot%20change%20the%20location%20of%20your%20App%20Engine%20application.>

Two App engine can't be running on the same project: you can check this easy diagram for more info:

[https://cloud.google.com/appengine/docs/standard/an-overview-of-app-engine#components\\_of\\_an\\_application](https://cloud.google.com/appengine/docs/standard/an-overview-of-app-engine#components_of_an_application) And you can't change location after setting it for your app Engine. <https://cloud.google.com/appengine/docs/standard/locations>

App Engine is regional and you cannot change an apps region after you set it. Therefore, the only way to have an app run in another region is by creating a new project and targeting the app engine to run in the required region (asia-northeast1 in our case).

Ref: <https://cloud.google.com/appengine/docs/locations>

### NEW QUESTION # 281

You have deployed an application on a single Compute Engine instance. The application writes logs to disk. Users start reporting errors with the application. You want to diagnose the problem.

What should you do?

- A. Install and configure the Cloud Logging Agent and view the logs from Cloud Logging.
- B. Configure a Health Check on the instance and set a Low Healthy Threshold value.
- C. Navigate to Cloud Logging and view the application logs.
- D. Connect to the instance's serial console and read the application logs.

**Answer: C**

Explanation:

Activity logging is enabled by default for all Compute Engine projects.

You can see your project's activity logs through the Logs Viewer in the Google Cloud Console:

In the Cloud Console, go to the Logging page.

Go to the Logging page

When in the Logs Viewer, select and filter your resource type from the first drop-down list.

From the All logs drop-down list, select `compute.googleapis.com/activity_log` to see Compute Engine activity logs.

[https://cloud.google.com/compute/docs/logging/activity-logs#viewing\\_logs](https://cloud.google.com/compute/docs/logging/activity-logs#viewing_logs) Besides:

Activity logs are provided as part of the Cloud Logging service. For more information about Logging in general, read the Cloud Logging documentation.

<https://cloud.google.com/compute/docs/logging/activity-logs>

### NEW QUESTION # 282

(You need to migrate multiple PostgreSQL databases from your on-premises data center to Google Cloud.

You want to significantly improve the performance of your databases while minimizing changes to your data schema and application code. You expect to exceed 150 TB of data per geographical region. You want to follow Google-recommended practices and minimize your operational costs. What should you do?)

- A. Migrate your data to Bigtable.
- B. Migrate your data to Firebase.
- C. Migrate your data to Spanner.
- **D. Migrate your data to AlloyDB.**

**Answer: D**

Explanation:

Let's analyze each option based on the requirements: PostgreSQL compatibility, significant performance improvement, minimal schema/code changes, handling large data volumes, Google-recommended practices, and cost minimization:

A: Migrate your data to AlloyDB: AlloyDB for PostgreSQL is a fully managed, PostgreSQL-compatible database service that offers significant performance improvements over standard PostgreSQL due to its architectural optimizations. It is designed to handle large data volumes and minimizes the need for schema and application code changes as it's wire-compatible with PostgreSQL. This aligns well with the requirements for performance improvement, minimal changes, large data, and being a Google-recommended option for PostgreSQL workloads.

B: Migrate your data to Spanner: Spanner is a globally distributed, horizontally scalable database with strong consistency. While it offers excellent scalability and performance, it's not directly PostgreSQL-compatible.

Migrating to Spanner would likely require significant schema and application code changes due to differences in data modeling and SQL dialect.

C: Migrate your data to Firebase: Firebase is a suite of mobile and web development tools, with its primary database offering being Firestore (a NoSQL document database) and Realtime Database. These are not PostgreSQL-compatible and would require substantial changes to the data model and application code.

D: Migrate your data to Bigtable: Bigtable is a highly scalable NoSQL wide-column store. It's not compatible with PostgreSQL and requires a completely different data model and application logic.

Therefore, AlloyDB is the most suitable option as it provides PostgreSQL compatibility for minimal migration effort, significant performance improvements, scalability for large data volumes, and is a recommended Google Cloud database service for PostgreSQL workloads.

Google Cloud Documentation References:

AlloyDB for PostgreSQL Overview: <https://cloud.google.com/alloydb/docs/overview> - This document highlights AlloyDB's PostgreSQL compatibility, performance benefits, scalability, and suitability for migrating existing PostgreSQL workloads.

Spanner Overview: <https://cloud.google.com/spanner/docs/overview> - This emphasizes Spanner's unique features and differences from traditional relational databases like PostgreSQL.

Firebase Documentation: <https://firebase.google.com/docs> - This outlines the features of Firebase, including Firestore and Realtime Database, highlighting their NoSQL nature and incompatibility with PostgreSQL.

Cloud Bigtable Overview: <https://cloud.google.com/bigtable/docs/overview> - This describes Bigtable as a NoSQL database, emphasizing its differences from relational databases like PostgreSQL.

### NEW QUESTION # 283

You have been asked to set up the billing configuration for a new Google Cloud customer. Your customer wants to group resources that share common IAM policies. What should you do?

- Answer: B**

Folders are nodes in the Cloud Platform Resource Hierarchy. A folder can contain projects, other folders, or a combination of both. Organizations can use folders to group projects under the organization node in a hierarchy. For example, your organization might contain multiple departments, each with its own set of Google Cloud resources. Folders allow you to group these resources on a per-department basis. Folders are used to group resources that share common IAM policies. While a folder can contain multiple folders or resources, a given folder or resource can have exactly one parent. <https://cloud.google.com/resource-manager/docs/creating-managing-folders>
