## dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q328-Q333):

### NEW QUESTION # 328

Which two are true for a dbt retry command?  
Choose 2 options.

- A. It retries the previous command if it is not a syntax error in a model.
- B. It reuses selectors from the previous command.
- C. It reruns all nodes in your previous invocation statement.
- D. It picks up from the error without running all of the upstream dependencies.
- E. It reads a manifest.json file to identify the models and tests that failed in the last run.

**Answer: A,E**

Explanation:

The correct answers are B and E.

The dbt retry command was introduced to help developers quickly re-run only what failed in the prior dbt invocation. According to dbt documentation, dbt retry examines metadata from the previous execution, including the run results and the manifest.json, to determine which nodes failed. This aligns with Option E, as dbt uses the manifest to identify the models, tests, and other nodes that errored or were not executed successfully.

Option B is also correct because dbt retry works only when the previous run failed due to execution errors (e.g., a warehouse failure or a logic error in SQL). If the failure was due to a syntax error that prevented dbt from compiling, there will be no valid manifest produced, so retry cannot execute. Thus, dbt retry can only re-run models when the previous failure occurred after successful compilation.

Options A and C are incorrect because retry does not run all nodes nor does it automatically pick up exactly where an execution stopped - instead, it runs failed and downstream unbuilt nodes as determined by the manifest. Option D is also incorrect; retry uses the execution metadata, not selectors, to determine what should run.

### NEW QUESTION # 329

A model passes its tests during development, but later fails when deployed on a less powerful production database. Which of the following might be the reason for this discrepancy?

- A. Performance-related test thresholds are too lenient in development.
- B. There's a bug in the version of dbt that runs in production.
- C. The test was accidentally disabled in the production dbt project.
- D. Source data distributions differ significantly between environments.

**Answer: A,D**

Explanation:

A and B could lead to tests passing in a forgiving environment but not catching issues in a more resource-constrained one. C would likely be caught earlier, and D is less likely

### NEW QUESTION # 330

(Multiple Select)

- A. If macros reference raw tables, those dependencies might not be reflected in dbt's lineage graphs.
- B. If macros themselves have dependencies on other macros, this adds an extra layer to consider.
- C. Macros generally make dependency tracking easier by encapsulating logic.
- D. Macros can completely obfuscate dependencies, making them untraceable.

**Answer: A,B**

Explanation:

Macros can introduce "hidden" dependencies. Also, if your macros build upon each other, you must track their internal dependencies as well.

### NEW QUESTION # 331

After merging a large pull request, you notice a critical issue introduced in one of the commits. What actions might be necessary?

- A. Use git revert to create a new commit that specifically undoes the problematic changes.
- B. Identify the problematic commit using git log or git blame.
- C. All of the above could be needed as part of the fix.
- D. Use git cherry-pick to apply specific commits from the reverted change to another branch, effectively restoring the necessary parts.

**Answer: C**

Explanation:

A: git revert provides a way to 'undo' changes safely. B: Identifying the source of the issue is essential. C: git cherry-pick lets you selectively reintroduce only the necessary portions in a controlled manner.

### NEW QUESTION # 332

A colleague asks, "Every time I make changes to my dbt\_project.yml I have to wait for errors during dbt compile. Is there a better way?" What would you suggest?

- A. Install a YAML linter within their code editor to catch formatting and basic schema errors.
- B. Have them write dbt schema tests for their configuration files.
- C. Thoroughly review dbts documentation for a complete list of valid properties to memorize.
- D. Manually validate the dbt\_project.yml against a fixed template file after each edit

**Answer: A**

Explanation:

Linters provide real-time feedback. Schema tests are useful but don't prevent all YAML issues. Memorization and manual checks are tedious-
