Cisco Implementing and Operating Cisco Security Core Technologies Sample Questions (Q579-Q584):

NEW QUESTION # 579
Refer to the exhibit.
Consider that any feature of DNS requests, such as the length off the domain name and the number of subdomains, can be used to construct models of expected behavior to which observed values can be compared. Which type of malicious attack are these values associated with?

- A. Heartbleed SSL Bug
- B. W32/AutoRun worm
- C. Spectre Worm
- D. Eternal Blue Windows

Answer: B

NEW QUESTION # 580
A Cisco ESA administrator has been tasked with configuring the Cisco ESA to ensure there are no viruses before quarantined emails are delivered. In addition, delivery of mail from known bad mail servers must be prevented. Which two actions must be taken in order to meet these requirements? (Choose two)

- A. Configure a recipient access table
- B. Deploy the Cisco ESA in the DMZ
- C. Scan quarantined emails using AntiVirus signatures
- D. Use outbreak filters from SenderBase
- E. Enable a message tracking service

Answer: C,D

Explanation:
Explanation Explanation We should scan emails using AntiVirus signatures to make sure there are no viruses attached in emails.
Note: A virus signature is the fingerprint of a virus. It is a set of unique data, or bits of code, that allow it to be identified. Antivirus software uses a virus signature to find a virus in a computer file system, allowing to detect, quarantine, and remove the virus.
SenderBase is an email reputation service designed to help email administrators research senders, identify legitimate sources of email, and block spammers. When the Cisco ESA receives messages from known or highly reputable senders, it delivers them directly to the end user without any content scanning. However, when the Cisco ESA receives email messages from unknown or less reputable senders, it performs antispam and antivirus scanning. Web servers and email gateways are generally located in the DMZ so Note: The recipient access table (RAT), not to be confused with remote-access Trojan (also RAT), is a Cisco ESA term that defines which recipients are accepted by a public listener.

NEW QUESTION # 582
Which type of DNS abuse exchanges data between two computers even when there is no direct connection?

- A. Network footprinting
- B. Malware installation
- C. Command-and-control communication
- D. Data exfiltration

Answer: D

Explanation:
Malware installation: This may be done by hijacking DNS queries and responding with malicious IP addresses.
Command & Control communication: As part of lateral movement, after an initial compromise, DNS communications is abused to communicate with a C2 server. This typically involves making periodic DNS queries from a computer in the target network for a domain controlled by the adversary. The responses contain encoded messages that may be used to perform unauthorized actions in the target network.
Network footprinting: Adversaries use DNS queries to build a map of the network. Attackers live off the terrain so developing a map is important to them.
Data theft (exfiltration): Abuse of DNS to transfer data; this may be performed by tunneling other protocols like FTP, SSH through DNS queries and responses. Attackers make multiple DNS queries from a compromised computer to a domain owned by the adversary. DNS tunneling can also be used for executing commands and transferring malware into the target network.
