NEW QUESTION # 51

Which two methods must be used to add switches into the fabric so that administrators can control how switches are added into

DCNM for private cloud management? (Choose two.)

- A. Cisco Prime Infrastructure
- **B. Seed IP**
- C. Cisco Cloud Director
- D. CDP AutoDiscovery
- **E. PowerOn Auto Provisioning**

Answer: B,E

NEW QUESTION # 52

Refer to the exhibit.

An organization is using DHCP Snooping within their network. A user on VLAN 41 on a new switch is complaining that an IP address is not being obtained. Which command should be configured on the switch interface in order to provide the user with network connectivity?

- A. ip dhcp snooping vlan 41
- B. ip dhcp snooping verify mac-address
- **C. ip dhcp snooping trust**
- D. ip dhcp snooping limit 41

Answer: C

Explanation:

To understand DHCP snooping we need to learn about DHCP spoofing attack first.

DHCP spoofing is a type of attack in that the attacker listens for DHCP Requests from clients and answers them with fake DHCP Response before the authorized DHCP Response comes to the clients. The fake DHCP Response often gives its IP address as the client default gateway -> all the traffic sent from the client will go through the attacker computer, the attacker becomes a "man-in-the-middle".

The attacker can have some ways to make sure its fake DHCP Response arrives first. In fact, if the attacker is "closer" than the DHCP Server then he doesn't need to do anything. Or he can DoS the DHCP Server so that it can't send the DHCP Response. DHCP snooping can prevent DHCP spoofing attacks. DHCP snooping is a Cisco Catalyst feature that determines which switch ports can respond to DHCP requests. Ports are identified as trusted and untrusted.

Only ports that connect to an authorized DHCP server are trusted, and allowed to send all types of DHCP messages. All other ports on the switch are untrusted and can send only DHCP requests. If a DHCP response is seen on an untrusted port, the port is shut down.

The port connected to a DHCP server should be configured as trusted port with the "ip dhcp snooping trust" command. Other ports connecting to hosts are untrusted ports by default.

In this question, we need to configure the uplink to "trust" (under interface Gi1/0/1) as shown below.

NEW QUESTION # 53

An engineer is configuring Cisco WSA and needs to deploy it in transparent mode. Which configuration component must be used to accomplish this goal?

- A. PBR on Cisco WSA
- B. MDA on the router
- **C. WCCP on switch**
- D. DNS resolution on Cisco WSA

Answer: C

Explanation:

To deploy Cisco WSA in transparent mode, the configuration component that must be used is WCCP on switch. WCCP stands for Web Cache Communication Protocol, which is a protocol that allows a network device (such as a switch) to redirect web traffic to a proxy server (such as Cisco WSA) transparently. This means that the client does not need to configure any proxy settings on the browser, and the proxy server can intercept and process the web requests and responses without the client's knowledge. WCCP can also provide load balancing and failover capabilities for multiple proxy servers.

The other options are incorrect because they are not required or relevant for transparent mode deployment.

Option A is incorrect because MDA (Multilink PPP Dial Access) is a feature that allows multiple physical links to be aggregated into

a single logical link for dial-up connections. It has nothing to do with transparent mode. Option B is incorrect because PBR (Policy-Based Routing) is a feature that allows routing decisions to be based on criteria other than the destination IP address, such as source IP address, protocol, port, etc. It is not necessary for transparent mode, as WCCP can handle the traffic redirection. Option D is incorrect because DNS resolution on Cisco WSA is not a configuration component, but a function that allows the proxy server to resolve domain names to IP addresses. It is not specific to transparent mode, as it is also used in explicit mode. References:

NEW QUESTION # 54

A switch with Dynamic ARP Inspection enabled has received a spoofed ARP response on a trusted interface.

How does the switch behave in this situation?

- A. It drops the packet after validation by using the IP & MAC Binding Table.
- B. It drops the packet without validation.
- C. It forwards the packet after validation by using the MAC Binding Table.
- **D. It forwards the packet without validation.**

Answer: D
