#### 問題 #58

Which HTTP status code indicates a response to a successful request?

- A. 0
- **B. 1**
- C. 2
- D. 3

答案: B

解題說明:

#### 問題 #59

Why is a REST API considered stateless?

- A. The REST API is an international API.
- B. The state of the server is not important when making requests.
- **C. The client requests to the server do not include state information.**
- D. No client context is stored on the server between requests.

答案: C

#### 問題 #60

You want to perform a dry run on the myPlays playbook and use a custom inventory file called myRouters.ini.

Which Ansible command would you use in this scenario?

- A. `ansible-playbook myPlays --check -i myRouters.ini`
- B. `ansible-playbook myPlays -extra-vars "dry run=True" myRouters.ini`
- **C. `ansible-playbook myPlays -extra-vars "inventory_file=myRouters .ini"`**
- D. `ansible-playbook myPlays -limit myRouters`

答案： C

### 問題 #61

You are asked to use the REST API to retrieve interface configuration information from your Junos device. You decide to use a cURL HTTP GET command to retrieve this information.

In this scenario, which two statements are correct? (Choose two.)

- A. You must have SSH enabled on the Junos device.
- B. You must Include the authentication Information with each request.
- C. You can retrieve this data in XML or JSON formats.
- D. You can retrieve this data in HTML or JSON formats.

答案： B,C

解題說明：

When using the REST API to retrieve interface configuration information from a Junos device:

Data Formats (C): The information can be retrieved in XML or JSON formats. These are the two standard data formats supported by the Junos REST API for representing configuration and operational data.

Authentication (D): For each HTTP request, especially when using tools like cURL, authentication information must be included. This is typically done using basic authentication (username and password) or an authentication token.

Option A is incorrect because HTML is not a supported format for REST API data retrieval in Junos, and Option B is incorrect because SSH is not required for REST API requests; the REST API typically uses HTTP/HTTPS.

Reference:

Junos REST API Documentation: Details the data formats (XML, JSON) supported by the Junos REST API and the need for authentication.

cURL Usage with REST API: Provides examples of how to use cURL with Junos REST API, including the necessity of providing authentication.

### 問題 #62

Which two data structures are used in JSON? (Choose two.)

- A. dictionaries
- B. arrays
- C. tuples
- D. objects

答案： B,D

解題說明：

In JSON (JavaScript Object Notation), the two primary data structures are:

Objects: These are collections of key-value pairs, where each key is a string, and the value can be a string, number, array, boolean, or another object. In Python, this structure is analogous to a dictionary.

Arrays: These are ordered lists of values, where each value can be of any data type, including another array or object. In Python, this structure is similar to a list.

Option A (tuples) and Option D (dictionaries) refer to Python-specific data structures and are not directly used in JSON.

Supporting Reference:

JSON Documentation and Tutorials: JSON objects and arrays are the standard data structures used in this format, as described in many tutorials and the official JSON documentation.
