They found difficulty getting hands on UiPath UiPath-AAAv1 real exam questions as it is undoubtedly a tough task. Besides this, it is also hard to pass the UiPath-AAAv1 exam on the first attempt. Nervousness and fear of exam is also daunting for applicants. The actual UiPath-AAAv1 Questions being offered by RealVCE will enable you to obtain the certification without any hassle.

Some practice materials keep droning on the useless points of knowledge. In contrast, being venerated for high quality and accuracy rate, our UiPath-AAAv1 training quiz received high reputation for their efficiency and accuracy rate originating from your interests, and the whole review process may cushioner than you have imagined before. Numerous of our loyal customers wrote to us to praise that the UiPath-AAAv1 Exam Questions are the same with the real exam questions and they passed UiPath-AAAv1 exam with ease.

UiPath Certified Professional Agentic Automation Associate (UiAAA) Sample Questions (Q45-Q50):

NEW QUESTION # 45

You want your agent to call an existing UiPath process by adding it in the Tools # Processes. Which prerequisite must be met before the process becomes selectable?

- A. The process only appears if it exposes at least one String output argument, regardless of where it is deployed, otherwise the Agent tool would be irrelevant for the Agent.
- B. The process only appears if it exposes at least one String input argument, regardless of where it is deployed, otherwise the Agent tool would be irrelevant for the Agent.
- C. Any process published anywhere in the tenant automatically appears in the list without additional deployment or permissions.
- **D. The process must already be published and deployed to a shared Orchestrator folder that you (and the agent) have permission to access.**

Answer: D

Explanation:

B is the correct answer - in UiPath's Agent Builder (Studio Web), when you want to invoke an existing UiPath process from an agent (via Tools # Processes), that process must meet two key prerequisites:

* It must be published and deployed to a shared Orchestrator folder

* You - and the agent - must have access to that folder

This ensures that:

* The agent can locate and run the process at execution time

* Role-based access control (RBAC) is respected

* Input/output arguments, execution logs, and exceptions are properly managed within the correct environment This aligns with UiPath's Orchestrator-integrated agent orchestration model, where security and deployment visibility are tightly governed. It also allows agent authors to reuse existing RPA logic inside dynamic agent flows without duplicating automation work.

Option A and D incorrectly imply that argument types affect process visibility - that's false. Agents can invoke processes with any argument signature, as long as mapping is defined.

Option C is incorrect - publishing alone is not enough. Deployment and permissions are required for the process to appear in the tool selector.

This model ensures that agents can call any compliant UiPath process securely, reliably, and in line with enterprise governance.

NEW QUESTION # 46

What is a characteristic of using Business Process Model and Notation by process excellence practitioners?

- A. It is only used for modeling static workflows without support for dynamic or unpredictable process changes.
- **B. It acts as an enabler for standards-based, model-driven collaboration between business groups and IT implementers.**
- C. It solely provides tools for designing aesthetic workflows, with no focus on controlled automation or dynamic process management.
- D. It lacks constructs such as error and exception handling support, limiting its use for controlled automation design.

Answer: B

Explanation:

The correct answer is C - Business Process Model and Notation (BPMN) is a standards-based modeling language used by process excellence practitioners to visually define, communicate, and govern business workflows.

In UiPath's Maestro orchestration platform, BPMN acts as a collaborative bridge between:

* Business stakeholders (who define processes and goals)

* Technical implementers (who build automations and agent logic)

BPMN includes rich constructs such as:

* Gateways for conditional logic

* Events for escalations and errors

* Tasks, subprocesses, and human interventions

This makes it ideal for dynamic, agentic workflows - not just static process mapping.

A and B are false - BPMN is built for adaptive, automated, and collaborative orchestration.

D is wrong - BPMN supports error handling, retries, and fallback flows, all critical in agentic automation.

NEW QUESTION # 47

A developer is implementing a few-shot structured prompt for an email classification task. The prompt includes examples of email subjects labeled with their respective classifications, such as "Spam" or "Work." What is the most important aspect to consider when

selecting examples for the prompt?

- A. Always use more than 10 examples, regardless of task complexity.
- B. Include examples with intentionally incorrect labels to improve training.
- **C. Choose examples that are diverse, relevant, and typical of the task's expected input.**
- D. Use random and unrelated examples to test the prompt's robustness.

Answer: C

Explanation:

The correct answer is C - the most critical aspect of designing a few-shot prompt in UiPath's LLM-driven agent framework is selecting examples that are diverse, representative, and relevant to the actual data the agent will encounter in production.

In a few-shot structured prompt, examples are used to demonstrate a pattern the model should follow.

UiPath recommends:

- * Using realistic examples from actual user inputs or support tickets
- * Covering edge cases or variations in phrasing and tone
- * Matching the desired output structure exactly (e.g., Input: ..., Output: ...) These patterns help the LLM infer the task correctly and maintain consistency, especially when processing unstructured inputs like email subjects.

Option A is incorrect - introducing incorrect labels degrades performance and adds confusion.

B is wrong - the number of examples depends on the task complexity and token budget. Sometimes 3-5 is ideal.

D undermines task alignment - random examples reduce accuracy and coherence.

UiPath's Prompt Engineering best practices prioritize grounded, contextually rich inputs, particularly when automating classification tasks like spam detection, triage, or intent recognition. High-quality, task-aligned examples lead to more reliable, human-like agents.

NEW QUESTION # 48

You are part of a Procurement team that often struggles with manually reviewing and comparing quotations from different vendors. This process is time-consuming, prone to human errors, and lacks real-time price validation. Keeping up with internal rules and market standards makes things even more difficult. This can cause problems and cost overruns. How agents can help?

- A. Agents rely on preloaded prices set by vendors and do not research market rates, verify compliance, or provide detailed validation, leading to potential errors and inefficiencies during quotation reviews.
- B. Agents only store vendor quotations without cross-verifying prices, researching market trends, or checking compliance with policies, leaving procurement officers to manually manage the entire validation process.
- C. Agents focus on sending reminders for deadlines but do not automate price analysis, extract item details, or validate compliance with internal rules, slowing down decision-making for procurement officers.
- **D. Agents automate price validation by extracting item details from quotations, use tools to research market prices, checking policy compliance, and cross-verifying prices against benchmarks before sharing results with procurement officers for better decision-making.**

Answer: D

Explanation:

C is correct - agents in UiPath can intelligently automate complex procurement workflows by combining tools like document extraction, web search for price benchmarks, policy validation, and LLM-based reasoning.

In this use case:

- * The agent extracts structured data (item, price, quantity) from multiple quotations
- * Compares prices with external market sources using Web Search or integrated APIs
- * Applies company policies or thresholds using system prompts and guardrails
- * Flags anomalies, escalates exceptions, or provides summarized comparisons This reduces:
 - * Manual effort
 - * Human error
 - * Turnaround time for approvals

And increases:

- * Policy compliance
- * Market alignment
- * Decision speed for procurement officers

Options A, B, and D all fall short of UiPath agent capabilities. These responses describe passive or limited automations, whereas agents are built to operate proactively and contextually, especially in high-value business functions like procurement.

This example reflects the agentic automation blueprint at work - combining perception, decision, and action across multiple systems in real time.

NEW QUESTION # 49

A team is designing an agent to convert plain text meeting notes into a formatted agenda (e.g., structured bullet points). Despite providing a few example transformations in the prompt, the agent generates agendas in inconsistent formats. What critical step was likely overlooked?

- A. Adding randomized formatting examples to test the agent's creativity.
- B. Providing only examples without additional context about the task.
- **C. Adding clear instructions detailing the output format.**
- D. Including constraints to limit the length of the agenda for simplicity.

Answer: C

Explanation:

This is a repeat of Question 16, and the correct answer remains A.

Even when few-shot examples are included, omitting clear formatting instructions leads to inconsistent outputs, which can break downstream processes in agentic automation.

UiPath's Prompt Engineering guidance emphasizes that instruction clarity is as important as examples - especially when output format matters (like agendas, classifications, or structured text).

An optimal prompt includes:

A task description (e.g., "Convert meeting notes into a 3-section agenda") Clear format instructions (e.g., use bullet points, bold headers) Few-shot examples Optional constraints like length or tone Without that first element - clear instructions - the LLM has to guess the output format, leading to variance and unreliability.
