Free PDF 2026 Saviynt Unparalleled Valid Brindumps SCAIP Free

Do you know why you feel pressured to work? That is because your own ability and experience are temporarily unable to adapt to current job requirements. Our SCAIP exam questions can upgrade your skills and experience to the current requirements in order to have the opportunity to make the next breakthrough. Don't doubt about our SCAIP Study Guide! Just look at the warm feedbacks from our loyal customers, they all have become more successful in their career with the help of our SCAIP practice engine.

Saviynt Certified Advanced IGA Professional (Level 200) Sample Questions (Q11-Q16):

NEW QUESTION # 11

What are the different features available under Role Intelligence? (Multi-Select)

- A. Role Governance
- B. Role Mining
- C. Role-Access Mismatches
- D. Entitlement Discovery

Answer: A,B,D

NEW QUESTION # 12

In the Saviynt App for ServiceNow, what options are available to refresh the RITM status in the ServiceNow app based on the respective Saviynt's status? (Multi-Select)

- A. It will be automatically updated in 1 minute via Request item history job in ServiceNow
- B. Make a Postman API call
- C. Click Refresh button on the RITM page in ServiceNow

- D. Regenerate application catalog item

Answer: A,C

Explanation:

In Saviynt-ServiceNow integration, the synchronization of RITM (Request Item) status between Saviynt and ServiceNow is handled through both manual and automated mechanisms.

Option B is correct because users or administrators can manually click the Refresh button on the RITM page in ServiceNow to immediately fetch the latest status from Saviynt. This is useful for real-time validation when monitoring request progress.

Option C is also correct as ServiceNow includes a Request Item History Job, which runs periodically (commonly every minute) to automatically sync and update the RITM status based on the latest state in Saviynt. This ensures near real-time consistency between both systems without manual intervention.

Option A is incorrect because Postman API calls are not a standard or supported operational method for end users to refresh RITM status. Option D is unrelated, as regenerating catalog items does not impact ticket status synchronization.

Thus, the correct answers are manual refresh and automated job-based synchronization.

NEW QUESTION # 13

What configuration types are needed to set up an emergency access role request?

- **A. All the above**
- B. Select a workflow under Global Configurations
- C. Select emergency access related parameters in the Role-level Configurations
- D. Select required feature access in SAV Role Configurations

Answer: A

Explanation:

Setting up an Emergency Access Role (EAR) request in Saviynt EIC requires multiple coordinated configurations across different components of the system. Option A is correct because emergency access roles must be configured at the role level, where parameters such as emergency access flag, duration, justification requirement, and elevated privileges are defined.

Option C is also necessary because SAV Role Configurations control which users (such as administrators or requesters) have the ability to request or manage emergency access roles. Without proper SAV role permissions, users cannot initiate or approve EAR requests.

Option D is equally important because workflows defined under Global Configurations govern the approval process, escalation paths, and auditing requirements for emergency access. These workflows ensure that emergency access is properly controlled, reviewed, and revoked after use.

Since all these configurations collectively enable emergency access functionality in Saviynt, the correct answer is All the above. This aligns with Saviynt best practices for implementing secure, auditable, and compliant emergency access management.

NEW QUESTION # 14

What are the different actions supported by User Update rule?

- **A. All the above**
- B. Send Email
- C. Generate Username
- D. Trigger Technical Rule

Answer: A

Explanation:

In Saviynt EIC, User Update Rules are powerful automation mechanisms used to perform actions based on user attribute changes or conditions defined through SQL queries. These rules support multiple actions that help streamline identity lifecycle management.

Option A is correct because User Update Rules can trigger Technical Rules, enabling further downstream processing such as provisioning, deprovisioning, or executing custom logic. This allows modular and scalable automation.

Option B is also valid since User Update Rules can be used to generate usernames dynamically based on defined patterns or business logic, especially during onboarding or identity updates.

Option C is correct as well because these rules support sending email notifications, which can be used for alerts, approvals, or informing stakeholders about identity changes.

Since all these actions are supported within User Update Rules, Option D (All the above) is correct. This highlights the flexibility of

User Update Rules in handling automation, communication, and identity data transformations within Saviynt EIC.

NEW QUESTION # 15

Which statement correctly describes the two major ServiceNow integration modes supported by Saviynt?

- A. ServiceNow as a Managed Application is only for branding and labels; ServiceNow as a Ticketing System is only for analytics.
- **B. ServiceNow as a Managed Application supports import, provisioning, and deprovisioning; ServiceNow as a Ticketing System supports ticket-based ITSM integration.**
- C. Both modes are the same and serve identical purposes.
- D. ServiceNow as a Managed Application is used only for SAV roles; ServiceNow as a Ticketing System is used only for password sync.

Answer: B

Explanation:

The correct answer is A . Saviynt documentation describes two major ServiceNow integration models:

ServiceNow as a Managed Application and ServiceNow as a Ticketing System . The managed application model is used for application-style integration, including reconciliation or import and provisioning or deprovisioning activities. The ticketing system model is used when ServiceNow functions as the ITSM workflow and ticket platform connected to Saviynt request processing. This distinction is repeatedly emphasized in the ServiceNow integration overview documentation.

Saviynt further notes that integration with ServiceNow is required to perform reconciliation, provisioning, and deprovisioning tasks, and separately documents ServiceNow as a ticketing system for request-related use cases. That means the two modes are complementary but not identical. Option D is therefore wrong because the modes serve different architectural purposes. Options B and C are incorrect because branding, analytics- only usage, SAV-role-only usage, and password-sync-only behavior do not describe the documented ServiceNow integration patterns. For Level 200 exam preparation, this is a high-value distinction: choose Managed Application when ServiceNow is the governed target system, and Ticketing System when ServiceNow is the ITSM workflow engine around Saviynt processes

NEW QUESTION # 16

.....

Our SCAIP test material is known for their good performance and massive learning resources. In general, users pay great attention to product performance. After a long period of development, our SCAIP research materials have a lot of innovation. We can guarantee that users will be able to operate flexibly, and we also take the feedback of users who use the Saviynt Certified Advanced IGA Professional (Level 200) exam dumps seriously. Once our researchers find that these recommendations are possible to implement, we will try to refine the details of the SCAIP Quiz guide. Our SCAIP quiz guide has been seeking innovation and continuous development.
