New Terraform-Associate-003 Mock Test & Terraform-Associate-003 Valid Test Vce

Our Terraform-Associate-003 study materials have enough confidence to provide the best Terraform-Associate-003 exam torrent for your study to pass it. With many years work experience, we have fast reaction speed to market change and need. In this way,

we have the latest Terraform-Associate-003 guide torrent. You don't worry about that how to keep up with the market trend, just follow us. We can say that our Terraform-Associate-003 Test Questions are the most suitable for examinee to pass the Terraform-Associate-003 exam, you will never regret to buy it.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q91-Q96):

NEW QUESTION # 91

Which configuration consistency errors does terraform validate report?

- **A. Declaring a resource identifier more than once**
- B. Terraform module isn't the latest version
- C. A mix of spaces and tabs in configuration files
- D. Differences between local and remote state

Answer: A

Explanation:

Terraform validate reports configuration consistency errors, such as declaring a resource identifier more than once. This means that the same resource type and name combination is used for multiple resource blocks, which is not allowed in Terraform. For example, resource "aws_instance" "example" {...} cannot be used more than once in the same configuration. Terraform validate does not report errors related to module versions, state differences, or formatting issues, as these are not relevant for checking the configuration syntax and structure.

References = [Validate Configuration], [Resource Syntax]

NEW QUESTION # 92

Which of the following commands would you use to access all of the attributes and details of a resource managed by Terraform?

- **A. terraform state show 'provider_type.name'**
- B. terraform state list 'provider_type.name'
- C. terraform state list
- D. terraform get 'provider_type.name'

Answer: A

Explanation:

The terraform state show command allows you to access all of the attributes and details of a resource managed by Terraform. You can use the resource address (e.g. provider_type.name) as an argument to show the information about a specific resource. The terraform state list command only shows the list of resources in the state, not their attributes. The terraform get command downloads and installs modules needed for the configuration. It does not show any information about resources. Reference = [Command: state show] and [Command: state list]

NEW QUESTION # 93

Which of the following is true about terraform apply?(Pick 2 correct responses)

- A. You cannot target specific resources for the operation.
- **B. Depending on provider specification, Terraform may need to destroy and recreate your infrastructure resources.**
- C. By default, it does not refresh your state file to reflect the current infrastructure configuration.
- D. You must pass the output of a terraform plan command to it.
- **E. It only operates on infrastructure defined in the current working directory or workspace.**

Answer: B,E

Explanation:

Comprehensive and Detailed in-Depth Explanation:

* C (#Correct)- If changes require a resource replacement (e.g., changing an immutable attribute like instance type), Terraform will destroy and recreate the resource.

* E (#Correct)- Terraform only applies the configuration in the current directory or workspace.

NEW QUESTION # 94

Which argument can you use to prevent unexpected updates to a module's configuration when calling Terraform Registry modules?

- A. count
- B. lifecycle
- C. source
- **D. version**

Answer: D

Explanation:

* The `version` argument in a module ensures Terraform uses a specific version of a module, preventing unintended updates.

* A (`source`)- Specifies the module source but does not control versioning.

* B (`count`)- Controls how many instances of a resource/module exist, not updates.

* D (`lifecycle`)- Controls how resources behave but does not control module versioning.

Official Terraform Documentation Reference:

Module Version Constraints

NEW QUESTION # 95

Terraform can only manage resource dependencies if you set them explicitly with the `depends_on` argument.

- A. True
- **B. False**

Answer: B

Explanation:

Terraform can manage resource dependencies implicitly or explicitly. Implicit dependencies are created when a resource references another resource or data source in its arguments. Terraform can infer the dependency from the reference and create or destroy the resources in the correct order. Explicit dependencies are created when you use the `depends_on` argument to specify that a resource depends on another resource or module. This is useful when Terraform cannot infer the dependency from the configuration or when you need to create a dependency for some reason outside of Terraform's scope.
