## QUESTION 1

What is the difference between a source tree and a shared tree in a multicast environment?

- A. To route traffic from source to receiver a source tree uses a link-state routing protocol and a shared tree uses a distance-vector routing protocol.
- B. A source tree has its root at the source, and a shared tree has its root at a designated rendezvous point.
- C. To stream multicast from source to receiver, a source tree uses PIM-SM and a shared tree uses PIM-DM.
- D. Source trees are the default type for bidirectional PIM, and PIM-DM uses shared trees by default.

Correct Answer: B

#### NEW QUESTION # 255

How does conditional matching operate with RPL?

- A. The matching identifies a set of criteria, and an action is taken based on whether the criteria are the same or different.
- B. The matching identifies a group of routes that are removed from the routing table when the administrator defined tags match.
- C. The matching identifies interfaces that run the same routing protocol and manipulates data based on the routing rules.
- D. The matching identifies tags that are placed on routes from neighboring autonomous systems and drops the routes if they are the same.

**Answer: A**

Explanation:

RPL (Routing Policy Language) operates by using conditional matching to evaluate routes based on specific criteria. The criteria can include attributes like prefixes, communities, route tags, local preferences, or AS paths. Once the match condition is evaluated,
