CompTIA PenTest+ Exam Sample Questions (Q141-Q146):

NEW QUESTION # 141
Which of the following is most important when communicating the need for vulnerability remediation to a client at the conclusion of a penetration test?

- A. Articulation of impact
- B. Articulation of cause
- C. Articulation of escalation
- D. Articulation of alignment

Answer: A

Explanation:
Articulation of impact explains the potential consequences and risks associated with the identified vulnerabilities. It helps the client understand the severity and urgency of the issues, making it clear why remediation is necessary and what the potential business or operational impacts could be if the vulnerabilities are not addressed. This understanding is crucial for motivating the client to take appropriate and timely action.

NEW QUESTION # 142
In a cloud environment, a security team discovers that an attacker accessed confidential information that was used to configure virtual machines during their initialization. Through which of the following features could this information have been accessed?

- A. Metadata services
- B. Block storage
- C. IAM
- D. Virtual private cloud

Answer: A

Explanation:
In a cloud environment, the information used to configure virtual machines during their initialization could have been accessed through metadata services.
* Metadata Services:
* Definition: Cloud service providers offer metadata services that provide information about the running instance, such as instance ID, hostname, network configurations, and user data.
* Access: These services are accessible from within the virtual machine and often include sensitive information used during the initialization and configuration of the VM.
* Other Features:
* IAM (Identity and Access Management): Manages permissions and access to resources but does not directly expose initialization data.
* Block Storage: Provides persistent storage but does not directly expose initialization data.
* Virtual Private Cloud (VPC): Provides network isolation for cloud resources but does not directly expose initialization data.
Pentest References:
* Cloud Security: Understanding how metadata services work and the potential risks associated with them is crucial for securing cloud environments.
* Exploitation: Metadata services can be exploited to retrieve sensitive data if not properly secured.
By accessing metadata services, an attacker can retrieve sensitive configuration information used during VM initialization, which can lead to further exploitation.

NEW QUESTION # 143
A penetration tester gains access to a Windows machine and wants to further enumerate users with native operating system credentials. Which of the following should the tester use?

- A. route.exe print
- B. net.exe commands
- C. netstat.exe -ntp
- D. strings.exe -a

Answer: B

Explanation:
To further enumerate users on a Windows machine using native operating system commands, the tester should use net.exe commands. The net command is a versatile tool that provides various network functionalities, including user enumeration.

NEW QUESTION # 144
A penetration tester is able to use a command injection vulnerability in a web application to get a reverse shell on a system After running a few commands, the tester runs the following:
python -c 'import pty; pty.spawn("/bin/bash")'
Which of the following actions Is the penetration tester performing?

- A. Writing a script for persistence
- B. Upgrading the shell
- C. Building a bind shell
- D. Privilege escalation

Answer: B

Explanation:
The penetration tester is performing an action called upgrading the shell, which means improving the functionality and interactivity of the shell. By running the python command, the penetration tester is spawning a new bash shell that has features such as tab completion, command history, and job control. This can help the penetration tester to execute commands more easily and efficiently.

NEW QUESTION # 145
A penetration tester analyzed a web-application log file and discovered an input that was sent to the company's web application. The input contains a string that says "WAITFOR." Which of the following attacks is being attempted?

- A. Remote command injection
- B. DLL injection
- C. SQL injection
- D. HTML injection

Answer: C

Explanation:
WAITFOR can be used in a type of SQL injection attack known as time delay SQL injection or blind SQL injection34. This attack works on the basis that true or false queries can be answered by the amount of time a request takes to complete. For example, an attacker can inject a WAITFOR command with a delay argument into an input field of a web application that uses SQL Server as its database. If the query returns true, then the web application will pause for the specified period of time before responding; if the query returns false, then the web application will respond immediately. By observing the response time, the attacker can infer information about the database structure and data1.
Based on this information, one possible answer to your question is A. SQL injection, because it is an attack that exploits a vulnerability in a web application that allows an attacker to execute arbitrary SQL commands on the database server.
