Cisco Implementing Cisco Application Centric Infrastructure Sample Questions (Q61-Q66):

NEW QUESTION # 61

Which function does spine switch perform in the Cisco ACI fabric?

- A. It bridges tenant packets for applying network policies.
- B. It connects to classic Ethernet devices in the multitier topology.
- C. It decapsulates VXLAN packets received from leaf switches.
- D. It stores all the entries of endpoints-to-VTEP mapping.

Answer: C

Explanation:

In an ACI fabric the spine's role is purely L3 - it terminates the VXLAN-GPE tunnels from the leaves, removes the outer VXLAN header (decapsulation), routes the packet to the correct leaf, then re-encapsulates it for onward delivery. The leaf switches handle bridging and policy enforcement, and neither store the full endpoint-to-VTEP mapping nor connect directly to traditional Ethernet devices.

NEW QUESTION # 62

What is the result of the pcEnfPref flag configured on the epg-App_EPG?

- A. Any configuration changes to the private network are validated.
- B. Access control rules for the private network are applied.
- C. Access control rules for the L3Out network are applied.
- D. Any changes to the underlying EPG objects are forbidden.

Answer: B

NEW QUESTION # 64

Refer to the exhibit.

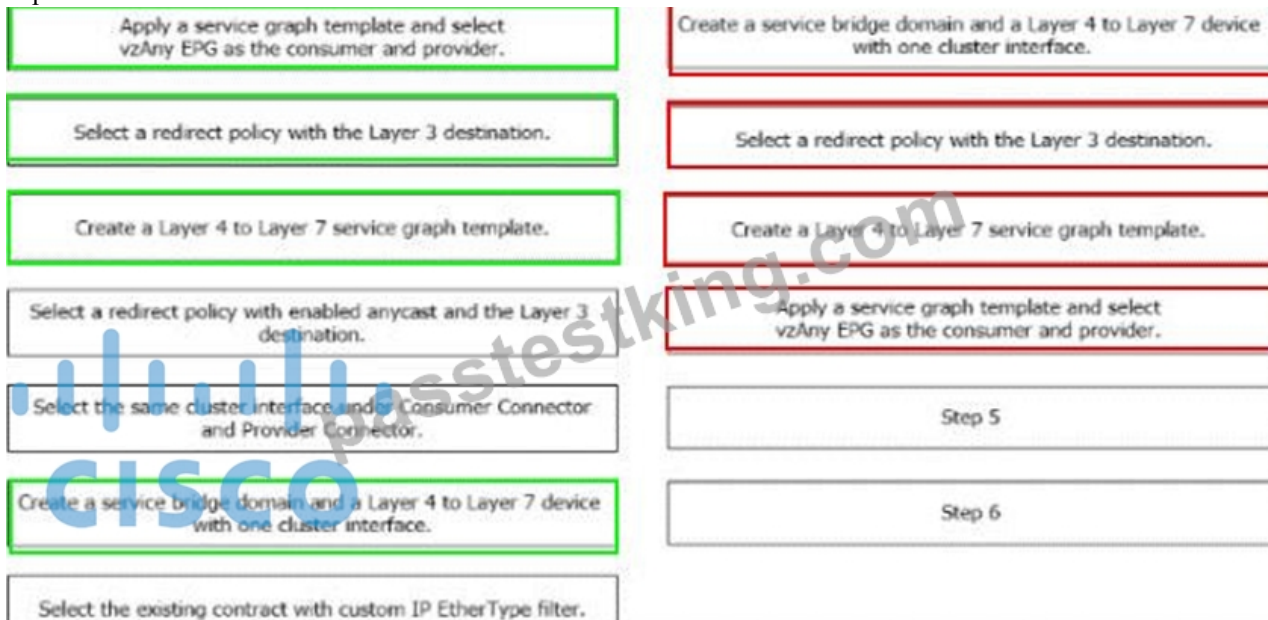

A Cisco ACI fabric is newly deployed, and the security team requires more visibility of all inter-EPG traffic flows. All traffic in a VRF must be forwarded to an existing firewall pair. During failover, the standby firewall must continue to use the same IP and MAC as the primary firewall. Drag and drop the steps from the left Into the Implementation order on the right to configure the service graph that meets the requirements. (Not all steps are used.)

NEW QUESTION # 65

Refer to the exhibit. A Cisco ACI fabric must allow any subnet to access the ACI fabric nodes.

Which set of actions meets this requirement?

- A. Provide OOB_CTR to ExtAccess_to_OOBMgmtNetwork.
Consume OOB_CTR from default EPG.
Add subnet 0.0.0.0/0 under ExtAccess to OOBMgmtNetwork.
- B. Consume OOB_CTR from ExtAccess_to_OOBMgmtNetwork.
Provide OOB_CTR to default EPG.
Add subnet 0.0.0.0/0 under default EPG.
- C. Consume OOB_CTR from ExtAccess_to_OOBMgmtNetwork.
Provide OOB_CTR to default EPG.

Add subnet 0.0.0.0/0 under ExtAccess_to_OOBMgmtNetwork.

- D. Provide OOB_CTR to ExtAccess_to_OOBMgmtNetwork.
Consume OOB_CTR from default EPG.
Add subnet 0.0.0.0/0 under default EPG.

Answer: C

Explanation:

The ExtAccess_to_OOBMgmtNetwork external management instance profile represents external entities that will access the ACI OOB management network.

To permit any source to reach the ACI fabric nodes, the subnet 0.0.0.0/0 (any IP) must be added under the external management profile, which is ExtAccess_to_OOBMgmtNetwork.

Using contracts, the default OOB EPG must provide the OOB_CTR contract, and the external access profile must consume it. This ensures correct directionality for access (outside-in management traffic).

The correct flow is: External entities (ExtAccess_to_OOBMgmtNetwork) consume the contract, while the default OOB EPG provides services to them.
