Associate-Cloud-Engineer Exam PDF - Associate-Cloud-Engineer Printable PDF

Our Associate-Cloud-Engineer exam dumps strive for providing you a comfortable study platform and continuously explore more functions to meet every customer's requirements. We may foresee the prosperous talent market with more and more workers attempting to reach a high level through the Google certification. To deliver on the commitments of our Associate-Cloud-Engineer Test Prep that we have made for the majority of candidates, we prioritize the research and development of our Associate-Cloud-

Engineer test braindumps, establishing action plans with clear goals of helping them get the Google certification.

To earn the Google Associate Cloud Engineer certification, candidates must pass a two-hour exam that consists of multiple-choice and multiple-select questions. Associate-Cloud-Engineer exam also includes performance-based scenarios that test the candidate's ability to solve real-world problems using GCP tools and services. Associate-Cloud-Engineer Exam Fee is \$125 USD, and the certification is valid for two years. By earning this certification, individuals can demonstrate their expertise in GCP and increase their chances of getting hired by organizations that use GCP for their cloud infrastructure.

Google Associate Cloud Engineer Exam Sample Questions (Q262-Q267):

NEW QUESTION # 262

You have created an application that is packaged into a Docker image. You want to deploy the Docker image as a workload on Google Kubernetes Engine. What should you do?

- A. Upload the image to Container Registry and create a Kubernetes Deployment referencing the image
- B. Upload the image to Cloud Storage and create a Kubernetes Service referencing the image
- C. Upload the image to Container Registry and create a Kubernetes Service referencing the image.
- D. Upload the image to Cloud Storage and create a Kubernetes Deployment referencing the image

Answer: C

NEW QUESTION # 263

You are managing a Data Warehouse on BigQuery. An external auditor will review your company's processes, and multiple external consultants will need view access to the data. You need to provide them with view access while following Google-recommended practices. What should you do?

- A. Create a Google Group that contains the consultants, and grant the group the role of BigQuery Viewer
- B. Create a Google Group that contains the consultants and grant the group the role of BigQuery Editor
- C. Grant each individual external consultant the role of BigQuery Viewer
- D. Grant each individual external consultant the role of BigQuery Editor

Answer: A

NEW QUESTION # 264

You've seen some errors in the logs for a specific Deployment. You've narrowed the issue down to the Pod named "ad-generator" that is throwing the errors. Your engineers aren't able to reproduce the error in any other environment. They've told you that if they could just "connect into the container" for 5 minutes, they could figure out the root cause. What steps would allow them to run commands against the container?

- A. Use the `kubectl exec -it -- /bin/bash` command to run a shell on that container.
- B. Use the `kubectl run` command to run a shell on that container.
- C. Use the `kubectl run ad-generator /bin/bash` command to run a shell on that container.
- D. Use the `kubectl exec -it ad-generator -- /bin/bash` command to run a shell on that container.

Answer: D

NEW QUESTION # 265

You need a dynamic way of provisioning VMs on Compute Engine. The exact specifications will be in a dedicated configuration file. You want to follow Google's recommended practices. Which method should you use?

- A. Unmanaged Instance Group
- B. Deployment Manager
- C. Cloud Composer
- D. Managed Instance Group

Answer: B

Explanation:

<https://cloud.google.com/deployment-manager/docs/configuration/create-basic-configuration>

NEW QUESTION # 266

You built an application on your development laptop that uses Google Cloud services. Your application uses Application Default Credentials for authentication and works fine on your development laptop. You want to migrate this application to a Compute Engine virtual machine (VM) and set up authentication using Google- recommended practices and minimal changes. What should you do?

- A. Assign appropriate access for Google services to the service account used by the Compute Engine VM.
- B. Store credentials for service accounts with appropriate access for Google services in a config file, and deploy this config file with your application.
- **C. Create a service account with appropriate access for Google services, and configure the application to use this account.**
- D. Store credentials for your user account with appropriate access for Google services in a config file, and deploy this config file with your application.

Answer: C

Explanation:

In general, Google recommends that each instance that needs to call a Google API should run as a service account with the minimum permissions necessary for that instance to do its job. In practice, this means you should configure service accounts for your instances with the following process: Create a new service account rather than using the Compute Engine default service account. Grant IAM roles to that service account for only the resources that it needs. Configure the instance to run as that service account. Grant the instance the

<https://www.googleapis.com/auth/cloud-platform> scope to allow full access to all Google Cloud APIs, so that the IAM permissions of the instance are completely determined by the IAM roles of the service account.

Avoid granting more access than necessary and regularly check your service account permissions to make sure they are up-to-date. https://cloud.google.com/compute/docs/access/create-enable-service-accounts-for-instances#best_prac
