More and more people have realized that they need to try their best to prepare for the XK0-005 exam.

CompTIA Linux+ Certification Exam Sample Questions (Q361-Q366):

NEW QUESTION # 361

A Linux administrator needs to remove all local firewall rules on a Linux system. Which of the following commands should the administrator run?

- **A. iptables -F**

- B. iptables -A
- C. iptables -D
- D. iptables -L

Answer: A

Explanation:

The iptables -F command flushes all the firewall rules, effectively removing them from the system. This command clears out all existing rules from all chains (INPUT, OUTPUT, and FORWARD), leaving the system with no active iptables rules.

NEW QUESTION # 362

A Linux administrator was informed that the server time zone is incorrect. Which of the following commands should the administrator use to correct the time zone?

- A. systemctl configure-timezone Africa/Nairobi
- B. **timedatectl set-timezone America/New_York**
- C. systemd-timezone set Asia/Tokyo
- D. tzconfig configure Europe/London

Answer: B

Explanation:

In modern Linux distributions using systemd, the correct way to change the system time zone is by using the timedatectl command:

cpp

CopyEdit

timedatectl set-timezone <TimeZone>

For example, to set the time zone to America/New_York, the command would be:

cpp

CopyEdit

timedatectl set-timezone America/New_York

NEW QUESTION # 363

Which of the following is the MOST common method used to access Windows systems that are running in a cloud provider from a Linux system?

- A. **XRDP**
- B. NX
- C. VNC
- D. SSH

Answer: A

NEW QUESTION # 364

A user is asking the systems administrator for assistance with writing a script to verify whether a file exists.

Given the following:

```
#1/bin/bash
filename=$1
<CONDITIONAL>
echo "File exists"
else
echo "File does not exist"
fi
```

Which of the following commands should replace the <CONDITIONAL> string?

- A. if [-d "\$filename"]; then
- B. if [-f "\$filename"] then
- C. if [-f "\$filename"]; then
- D. if [-f "\$filename"]; while

Answer: C

Explanation:

Explanation

The command if [-f "\$filename"]; then checks if the variable \$filename refers to a regular file that exists.

The -f option is used to test for files. If the condition is true, the commands after then are executed. This is the correct way to replace the <CONDITIONAL> string. The other options are incorrect because they either use the wrong option (-d tests for directories), the wrong syntax (missing a semicolon after the condition), or the wrong keyword (while is used for loops, not conditions).

NEW QUESTION # 365

A systems administrator is investigating an issue in which one of the servers is not booting up properly. The journalctl entries show the following:

```
Sep 16 20:30:43 server kernel: acpi PNP0A03:00: _OSC failed (AE_NOT_FOUND);
-- Subject: Unit dev-mapper-centos\x2dapp.device has failed
Sep 16 20:32:15 server systemd[1]: Dependency failed for /opt/app
-- Subject: Unit opt-app.mount has failed
-- Unit opt-app.mount has failed
Sep 16 20:32:15 server systemd[1]: Dependency failed for Local File Systems.
-- Subject: Unit local-fs.target has failed
-- Unit local-fs.target has failed.
Sep 16 20:32:15 server systemd[1]: Dependency failed for Relabel all filesystem, if necessary.
-- Subject: Unit rhel-autorelabel.service has failed
-- Unit rhel-autorelabel.service has failed.
```

Which of the following will allow the administrator to boot the Linux system to normal mode quickly?

- A. Trigger a filesystem relabel and reboot.
- B. Comment out the /opt/app filesystem in /etc/fstab and reboot.
- C. Reformat the /opt/app filesystem and reboot.
- D. Perform filesystem checks on local filesystems and reboot.

Answer: B

Explanation:

Explanation

The fastest way to boot the Linux system to normal mode is to comment out the /opt/app filesystem in

/etc/fstab and reboot. This will prevent the system from trying to mount the /opt/app filesystem at boot time, which causes an error because the filesystem does not exist or is corrupted. Commenting out a line in /etc/fstab can be done by adding a # symbol at the beginning of the line. Rebooting the system will apply the changes and allow the system to boot normally. Reformatting the /opt/app filesystem will not help to boot the system, as it will erase any data on the filesystem and require manual intervention to create a new filesystem.

Performing filesystem checks on local filesystems will not help to boot the system, as it will not fix the missing or corrupted /opt/app filesystem. Triggering a filesystem relabel will not help to boot the system, as it will only change the security context of files and directories according to SELinux policy.
