## Salesforce Certified Slack Developer Sample Questions (Q132-Q137):

### NEW QUESTION # 132

When should a workspace administrator consider using the Slack Admin API?

- A. For integrating Slack with external non-workspace-related databases and services
- B. For creating custom Slack emojis and GIFs accessible to all users in the workspace
- C. To develop an internal communication strategy that includes creating and managing content within Slack channels
- **D. When setting up a system to automate channel creation and manage app installations across multiple workspaces in an organization**

**Answer: D**

Explanation:

When setting up a system to automate channel creation and manage app installations across multiple workspaces in an organization The Admin API is ideal for automating and managing tasks like channel creation and app installations across multiple workspaces. It allows administrators to efficiently control and standardize these aspects of workspace management, ensuring consistency and adherence to organizational policies.

Why not the other options:

\*The creation of custom emojis and GIFs is not a function of the Admin API.

\*The Admin API is not focused on internal communication strategies or content management within channels.

\*The Admin API is specifically for Slack workspace administration and not for integrating with external databases or services

unrelated to workspace management.

### NEW QUESTION # 133

Your company's Slack app is designed to streamline project management.

What design decision best aligns with Slack's commitment to a simplified, efficient work life?

- A. Integration of a dashboard within Slack that provides an overview of project status and key metrics
- B. The app posts real-time updates in the general channel about every minor change in project status
- C. Requiring users to fill out a detailed form in Slack for every task they complete
- D. A bot that sends direct messages to project members every time there is a task update

**Answer: A**

Explanation:

Integration of a dashboard within Slack that provides an overview of project status and key metrics Integrating a dashboard within Slack to provide a consolidated view of project status and key metrics aligns with Slack's ethos of simplifying work life. It allows users to quickly access vital information in one place, enhancing efficiency and user experience.

Why not the other options:

\*Continuous real-time updates for every minor change can overwhelm users and clutter the general channel.

\*Frequent direct messages for each task update can become disruptive and may lead to notification fatigue..

\*Requiring detailed forms for task completion can be tedious and counterproductive, complicating rather than simplifying the process.

### NEW QUESTION # 134

A company is planning to develop a Slack app that integrates with their external project management system. This app needs to synchronize project updates and allow task assignments within Slack. When should a collaborative team be set up for this development?

- A. Once user feedback is received post-deployment
- B. Only during the coding phase of the app
- C. As soon as the project is approved
- D. After the first version of the app is completed

**Answer: C**

Explanation:

As soon as the project is approved Setting up a collaborative team right from the project's approval ensures that all aspects of the app, from understanding the integration requirements to designing the user interface, are considered and addressed effectively. Early collaboration helps in aligning the app development with the business needs and technical constraints.

Why not the other options:

\*Waiting until the coding phase may lead to overlooking design and integration considerations.

\*Completing the first version without collaboration could result in missing critical functionality and integration needs.

\*Waiting for user feedback post-deployment misses out on the essential collaborative input during development phases.

### NEW QUESTION # 135

A Slack app is being developed to facilitate quick decision-making in a team. The app needs to allow team members to vote on different options quickly.

What interactive component would be most suitable for this functionality?

- A. Send a modal to each team member to submit their vote
- B. Create a channel poll where members post their votes as messages
- C. Implement interactive buttons in a message for team members to click and vote
- D. Use a bot to collect votes via direct messages from each team member

**Answer: C**

Explanation:

Implement interactive buttons in a message for team members to click and vote Interactive buttons in a message are an efficient and

user-friendly way to collect votes. They provide a straightforward interface for team members to quickly express their preferences without leaving the channel or conversation.

Why not the other options:

\*Direct messages for voting can be less engaging and less transparent compared to a shared environment..

\*Voting via messages in a channel can lead to unstructured and cluttered conversations.

\*Sending a modal to each team member for voting is more intrusive and disrupts the workflow more than necessary.

### NEW QUESTION # 136

When developing an app for Slack's Enterprise Grid, how should you design your app to handle data and functionality across multiple workspaces within the Grid?

- A. Focus on a single workspace functionality, as Enterprise Grid will automatically replicate this across all other workspaces
- **B. Implement functionality to respect workspace boundaries, allowing for data segregation and workspace-specific configurations**
- C. Assume each workspace operates independently and does not share data with other workspaces
- D. Design the app to aggregate data from all workspaces in a centralized database without considering workspace-specific permissions

**Answer: B**

Explanation:

Implement functionality to respect workspace boundaries, allowing for data segregation and workspace-specific configurations For Slack's Enterprise Grid, it's crucial to design apps that respect workspace boundaries, allowing for data segregation and workspace-specific configurations. This approach ensures that each workspace within the Grid can operate independently with its own data and settings, while still being part of the larger organizational structure.

Why not the other options:

\*While workspaces operate independently, an Enterprise Grid app may need to interact across multiple workspaces.

\*Aggregating data from all workspaces without considering specific permissions can lead to security and privacy issues.

\*Focusing solely on single workspace functionality disregards the interconnected nature of Enterprise Grid and its multiple workspaces.
