CompTIA A+ Certification Exam: Core 2 Sample Questions (Q578-Q583):

NEW QUESTION # 578
A technician removed a virus from a user's device. The user returned the device a week later with the same virus on it. Which of the following should the technician do to prevent future infections?

- A. Clean the environment reinstallation.
- B. Disable System Restore.
- C. Install the latest OS patches.
- D. Educate the end user.

Answer: D

Explanation:
Educating the end user is the best way to prevent future infections by viruses or other malware. The technician should teach the user how to avoid risky behaviors, such as opening suspicious attachments, clicking on unknown links, downloading untrusted software, etc. Disabling System Restore, installing the latest OS patches and performing a clean installation are possible ways to remove existing infections, but they do not prevent future ones. NEW QUESTION # 579
Which of the following would most likely be used to extend the life of a device?

- A. Electrostatic discharge mat
- B. Green disposal
- C. Battery backup
- D. Proper ventilation

Answer: D

Explanation:
Proper ventilation is a factor that can extend the life of a device by preventing overheating and thermal damage to the device's components. Proper ventilation means ensuring that there is enough airflow around and inside the device to dissipate heat and maintain a suitable temperature for optimal performance. Proper ventilation can be achieved by using fans, heat sinks, vents, or liquid cooling systems, as well as avoiding placing the device near heat sources or in enclosed spaces. Battery backup, electrostatic discharge mat, and green disposal are not factors that can extend the life of a device.

NEW QUESTION # 580
A technician is configuring a SOHO device Company policy dictates that static IP addresses cannot be used. The company wants the server to maintain the same IP address at all times. Which of the following should the technician use?

- A. NAT
- B. Port forwarding
- C. DNS A record
- D. DHCP reservation

Answer: D

Explanation:

The technician should use DHCP reservation to maintain the same IP address for the server at all times. DHCP reservation allows the server to obtain an IP address dynamically from the DHCP server, while ensuring that the same IP address is assigned to the server each time it requests an IP address.

NEW QUESTION # 581

A technician has verified that a user's computer has a virus and the antivirus software is out of date. Which of the following steps should the technician take next?

- A. Educate the end user about viruses.
- B. Use a previous restore point.
- C. Download the latest virus definitions.
- D. Quarantine the computer.

Answer: C

Explanation:

The first step in removing a virus from a computer is to update the antivirus software with the latest virus definitions. Virus definitions are files that contain information about the characteristics and behavior of known viruses and malware. They help the antivirus software to identify and remove the malicious threats from the computer. Without the latest virus definitions, the antivirus software may not be able to detect or remove the virus that infected the user's computer. Therefore, the technician should download the latest virus definitions from the antivirus vendor's website or use the update feature in the antivirus program before scanning the computer for viruses.

NEW QUESTION # 582

A technician is doing a bare-metal installation of the Windows 10 operating system. Which of the following prerequisites must be in place before the technician can start the installation process?

- A. Sufficient storage space
- B. UEFI firmware
- C. Legacy BIOS
- D. Product key
- E. Internet connection

Answer: A

Explanation:

Before starting a bare-metal installation of Windows 10, ensuring that there is sufficient storage space on the system's hard drive or SSD is crucial. This is because the installation files need enough room to be copied and for the operating system to be installed and function properly. Without adequate storage, the installation process can fail or the operating system might not perform optimally. Other prerequisites like internet connection, product key, and specific firmware types might be necessary at different stages of installation or activation, but the fundamental requirement is enough storage space to accommodate the new OS.
