Nutanix Certified Professional - Unified Storage (NCP-US) v6.10 (NCP-US-6.10) Free Practice Test

Question 41

An administrator is managing two Nutanix clusters that are both hosting Nutanix Files instances. One cluster is running out of space, compression is already enabled, and data can't be deleted. Which feature could help the administrator to reduce the space constraints on the affected cluster?

- A. Smart Tiering
- B. Smart DR
- C. Object Replication
- D. Smart Sync

Correct Answer: A

BTW, DOWNLOAD part of ExamPrepAway NCP-US-6.10 dumps from Cloud Storage: <https://drive.google.com/open?id=1VhOgNE4Ta8i8dac5ateeGTyEtNwfl7pt>

Regularly updated material content to ensure you are always practicing with the most up-to-date preparation material which covers all the changes that are made to the Nutanix Certified Professional - Unified Storage (NCP-US) v6.10 (NCP-US-6.10) exam questions from ExamPrepAway. Our preparation material is built in such a way that it will help everyone even a beginner to reach his goal of clearing the Nutanix NCP-US-6.10 Exam Dumps from ExamPrepAway just in one attempt.

In order to provide most comfortable review process and straightaway dumps to those NCP-US-6.10 candidates, we offer you three versions of NCP-US-6.10 exam software: the PDF version, the online version, and software version. There will be one version right for you and help you quickly pass the NCP-US-6.10 with ease, so that you can obtain the most authoritative international recognition on your IT ability.

NCP-US-6.10 Practice Exams Free - NCP-US-6.10 Updated Demo

Our company is a well-known multinational company, has its own complete sales system and after-sales service worldwide. Our NCP-US-6.10 real study guide have become a critically acclaimed enterprise, so, if you are preparing for the exam qualification and

obtain the corresponding certificate, so our company launched NCP-US-6.10 Exam Questions are the most reliable choice of you. The service tenet of our company and all the staff work mission is: through constant innovation and providing the best quality service, make the NCP-US-6.10 question guide become the best customers electronic test study materials.

Nutanix Certified Professional - Unified Storage (NCP-US) v6.10 Sample Questions (Q106-Q111):

NEW QUESTION # 106

Question:

An administrator is preparing to deploy Nutanix Objects on an AHV-based Nutanix cluster in a multi-cluster environment. The Virtual IP address and Data Services IP address have already been configured on the AHV cluster. Which additional IP address should be configured for successful Objects deployment?

- A. Fallback Virtual IP of Prism Element on AHV cluster
- **B. Fallback Virtual IP on cluster where Prism Central is deployed**
- C. IPv6 address of Prism Element on AHV cluster
- D. Data Services IP on cluster where Prism Central is deployed

Answer: B

Explanation:

When deploying Nutanix Objects in a multi-cluster environment, Prism Central coordinates deployment across clusters.

In the NUSA deployment module, it's emphasized:

"Prism Central requires a Fallback Virtual IP (VIP) on the cluster it manages to ensure management traffic can be redirected even if a CVM or Prism Element service fails." Thus, the Fallback Virtual IP on the cluster where Prism Central is deployed is a critical additional IP address for:

Ensuring management continuity

Supporting Object service deployment across clusters

The other options (like IPv6 or DSIP on Prism Central's cluster) are not required specifically for Nutanix Objects deployment.

NEW QUESTION # 107

An administrator has been asked to implement a solution that allows users to:

- * Recover single files
- * Retrieve shares
- * Set snapshot frequency

Which feature should be used?

- A. Access Based Enumeration
- B. Protection Domain
- **C. Self-Service Restore**
- D. Smart DR

Answer: C

Explanation:

According to the Nutanix Unified Storage Administration (NUSA) course, the Self-Service Restore (SSR) feature empowers end-users to recover individual files and shares from file server snapshots without administrative intervention. It also allows users to configure snapshot schedules (snapshot frequency) as required.

This feature is explicitly described in the module "Configuring and Utilizing Self-Service Restore (SSR)" of the NUSA course, stating: "Self-Service Restore enables end-users to browse available snapshots of their shares and folders, allowing them to recover individual files or entire folders independently. Snapshot frequency and retention can be configured to meet data protection requirements." In contrast:

* Protection Domains are used for DR (Disaster Recovery) and not for per-file restore by end-users.

* Smart DR is also a DR-focused feature, not for user-level file recovery.

* Access Based Enumeration (ABE) pertains to share visibility control, not file recovery.

Reference:

Nutanix Unified Storage Administration (NUSA) course - Module: Configuring and Utilizing Self-Service Restore (SSR).

Nutanix Unified Storage (NCP-US) Study Guide - Topic: Enabling SSR for File Server Shares.

NEW QUESTION # 108

Which term describes Nutanix Files blocking access to a file until its file state is manually changed?

- A. Deleted
- B. Cleaned
- C. Unquarantined
- **D. Quarantined**

Answer: D

Explanation:

In Nutanix Files, there is a built-in feature called File Quarantine. When certain suspicious or malicious activity is detected—often through integrations with file scanning tools or security alerts—the file is quarantined. In a quarantined state, access to the file is blocked until an administrator manually reviews and decides to either unquarantine or delete the file.

The NCP-US and NUSA courses highlight this term as follows:

"Files that are detected to have potential issues or threats are placed in a quarantined state by Nutanix Files.

This quarantined state restricts user access to ensure security and requires manual administrative action to restore access." Thus, the correct term is Quarantined.

NEW QUESTION # 109

An administrator has recently added several NGT-enabled VMs with in-guest iSCSI initiators to a Volume Group (VG) using IP addresses in the VG allowlist. Several days later, the administrator restored the VG, after which the VMs lost connectivity to the Volume Group.

What should the administrator have done differently to prevent this from happening?

- **A. Use the iSCSI IQN entry in the VG allowlist.**
- B. Use the NIC MAC address of the VM's in the VG allow list.
- C. Use the VM hostname in the VG allowlist.
- D. Use the VM UUID in the VG allow list.

Answer: A

Explanation:

Volume Groups (VGs) require persistent identifiers for initiators in the allowlist. IP addresses can change during VM restores/reboots, breaking connectivity. The iSCSI Qualified Name (IQN) is a static, unique identifier for iSCSI initiators and persists across VM operations, ensuring stable access.

* Option B/C/D (VM UUID, hostname, MAC): These are unrelated to iSCSI authentication. Nutanix Volume Groups exclusively use IQNs or IPs (not recommended) for allowlisting.

Reference: Nutanix Unified Storage Administration (NUSA) Course Study Guide:

"Always use iSCSI IQN in Volume Group allowlists for NGT-enabled VMs. IP addresses are ephemeral and may change after restores, causing connectivity loss." (Section: "Configuring Volume Group Access Control") (Module: "Nutanix Volumes Best Practices") Nutanix Volumes Documentation:

"For persistent iSCSI connectivity, configure the allowlist with initiator IQNs instead of dynamic IP addresses." (Source: Volumes Configuration Guide, "Allowlist Management")

NEW QUESTION # 110

An administrator has noticed that the object stores have stopped gathering analytics data approximately nine months after they were enabled. How can the administrator resume Data Lens functionality?

- **A. Disable and re-enable analytics on the object store**
- B. Remove and re-add IAM user permissions on the object store
- C. Rename the bucket within the object store
- D. Disable and re-enable versioning on the object store

Answer: A

Explanation:

The issue involves Nutanix Objects stopping the collection of analytics data for Nutanix Data Lens approximately nine months after being enabled. To resume Data Lens functionality, the administrator should disable and re-enable analytics on the object store.

Nutanix Data Lens is a cloud-based service that provides analytics and lifecycle management for Nutanix Objects, and issues with analytics data collection can often be resolved by resetting the analytics configuration.

The Nutanix Unified Storage Administration (NUSA) course states, "If Nutanix Data Lens stops gathering analytics data for an object store, a common troubleshooting step is to disable and re-enable analytics on the object store to reset the connection and resume data collection." This process forces the object store to re-establish its integration with Data Lens, clearing any potential configuration or connectivity issues that may have caused the analytics to stop. The nine-month period suggests a possible timeout or licensing issue with Data Lens, which can be resolved by this action.

The Nutanix Certified Professional - Unified Storage (NCP-US) study guide further elaborates that

"disabling and re-enabling analytics on a Nutanix Objects store is an effective way to troubleshoot Data Lens functionality issues, ensuring that the object store re-syncs with Data Lens for analytics data collection." The administrator can perform this action through Prism Central by navigating to the Nutanix Objects configuration, disabling analytics for the affected object store, and then re-enabling it.

The other options are incorrect:

- * Rename the bucket within the object store: Renaming a bucket does not affect Data Lens integration or analytics data collection, as Data Lens operates at the object store level, not the bucket level.

- * Remove and re-add IAM user permissions on the object store: IAM user permissions control access to the object store but are not directly related to Data Lens analytics collection. Changing permissions is unlikely to resolve this issue.

- * Disable and re-enable versioning on the object store: Versioning allows multiple versions of objects to be stored but does not impact Data Lens analytics functionality.

The NUSA course documentation emphasizes that "resetting analytics by disabling and re-enabling the feature on the object store is a standard troubleshooting step to resume Data Lens functionality when analytics data collection stops unexpectedly." References: Nutanix Unified Storage Administration (NUSA) Course, Section on Nutanix Data Lens: "Troubleshooting Data Lens analytics for Nutanix Objects." Nutanix Certified Professional - Unified Storage (NCP-US) Study Guide, Topic 4: Troubleshoot Nutanix Unified Storage, Subtopic: "Resolving Data Lens analytics issues for Nutanix Objects." Nutanix Documentation (<https://www.nutanix.com>), Nutanix Data Lens Guide: "Troubleshooting analytics data collection for object stores."
