TDA-C01 New Braindumps Free - Test TDA-C01 Questions Pdf

Our TDA-C01 exam prep has already become a famous brand all over the world in this field since we have engaged in compiling the TDA-C01 practice materials for more than ten years and have got a fruitful outcome. You are welcome to download the free demos to have a general idea about our TDA-C01 study questions. Since different people have different preferences, we have prepared three kinds of different versions of our TDA-C01 training guide: PDF, Online App and software.

Tableau Certified Data Analyst Sample Questions (Q49-Q54):

NEW QUESTION # 49

You create a parameter named Choose Region that contains values from a field named Region.

You want users to be able to use the Choose Region parameter to interact with a chart by toggling between different regions. What should you do next?

- A. Add the [Region] = [choose Region] formula to the Filters card
- B. Set the Choose Region parameter to Single Value (list)
- C. Add Region to the Filters card**
- D. Add the Choose Region parameter to the Pages card

Answer: C

Explanation:

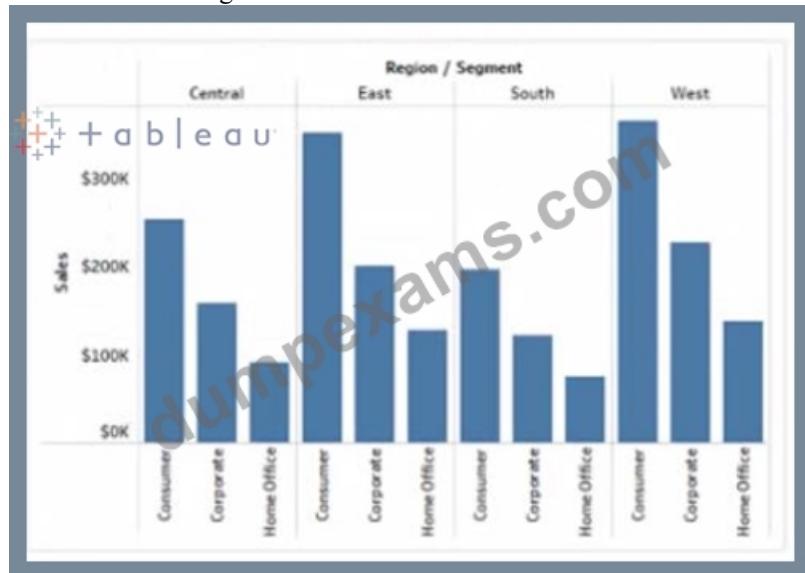

To use the Choose Region parameter to interact with a chart by toggling between different regions, you should add the [Region] = [Choose Region] formula to the Filters card. This formula will create a boolean filter that returns TRUE if the value in the Region field

matches the value in the Choose Region parameter, and FALSE otherwise. You can add this formula to the Filters card by right-clicking on it and selecting Add Filter from the menu. Then you can select Condition from the dialog box and enter the formula in the text box. This will filter the chart to show only the data for the selected region.

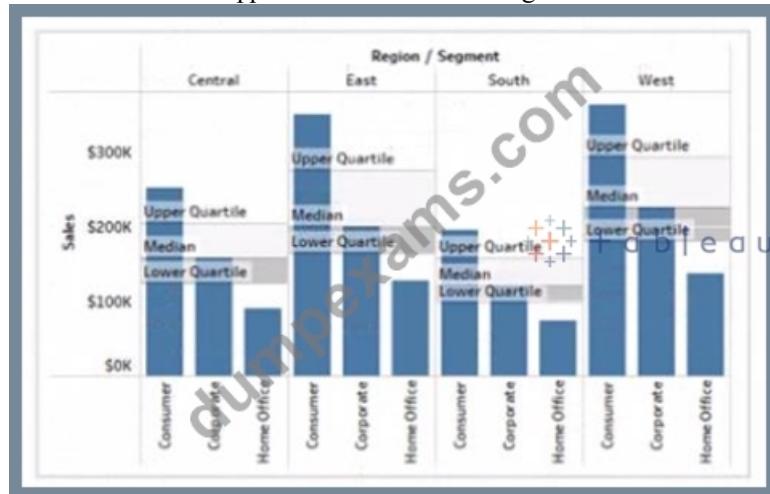

The other options are not correct for this scenario. Adding Region to the Filters card will create a categorical filter that shows a list of values from the Region field, but it will not use the Choose Region parameter. Adding the Choose Region parameter to the Pages card will create a page control that allows you to cycle through different values of the parameter, but it will not filter the chart. Setting the Choose Region parameter to Single Value (list) will change how the parameter control appears on the worksheet, but it will not affect how it interacts with the chart. NEW QUESTION # 50

You have the following bar chart.

You want the chart to appear as shown in the Mowing exhibit.

What should you add?

- A. A reference band
- B. An average line
- C. A reference line
- D. A distribution band

Answer: D

Explanation:

A reference band is a shaded area that shows a range of values on an axis. You can use a reference band to highlight a target range, a confidence interval, or a standard deviation. In this case, you want to add a reference band that shows the range of values from 0

to 100 on the y-axis. This will create a shaded area behind the bars that indicates the percentage of sales.

To add a reference band, you need to do the following steps:

Click on the Analytics tab on the left side of the workbook to open the Analytics pane. You will see a list of analytical objects that you can drag and drop onto your worksheet.

Drag Reference Band from the Analytics pane to Y-Axis on the worksheet. This will add a reference band on the y-axis that shows the average and confidence interval for all values.

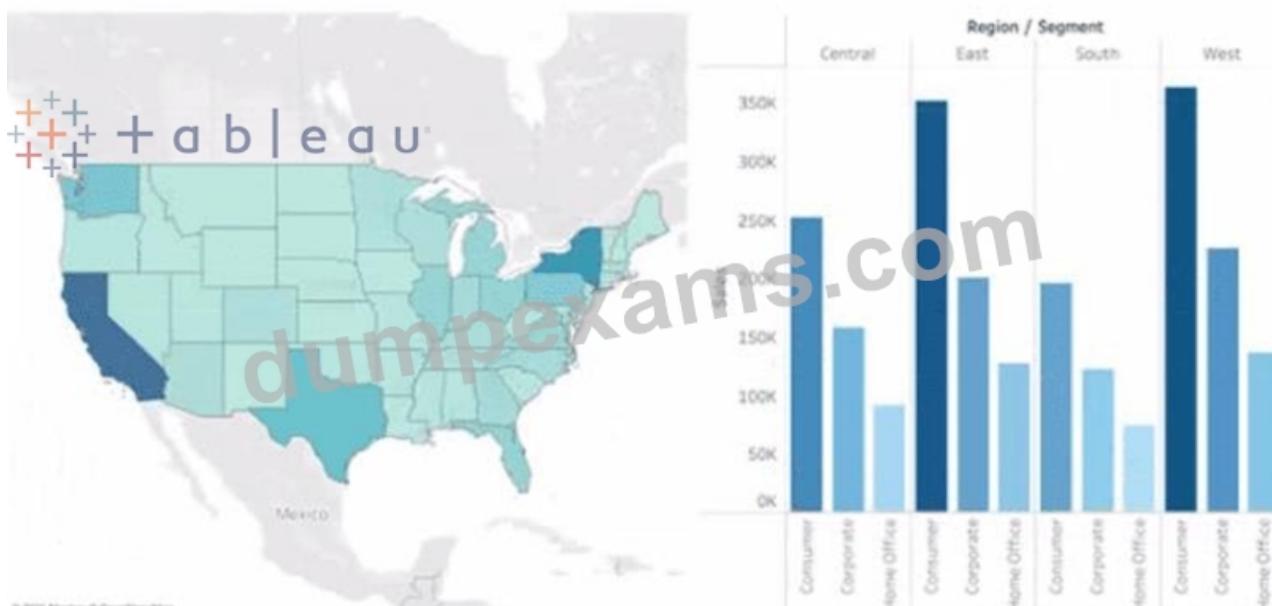

Click on the Edit button on the reference band to open the Edit Reference Band dialog box. You will see options to customize your reference band.

Change the Band From value to 0 and the Band To value to 100. This will change the reference band to show the range of values from 0 to 100 on the y-axis.

Click OK to apply the changes. You will see that the reference band now shows a shaded area behind the bars.

NEW QUESTION # 51

You have the following dashboard that contains two visualizations.

You want to show only one visualization at time. Users must be able to switch between visualizations.

What should you me?

- A. Dashboard actions
- B. Show/hide buttons
- C. Worksheet actions
- D. A parameter and a calculated filed

Answer: D

Explanation:

In Tableau, you can manage the visibility of different visualizations on a dashboard using various techniques.

Among the options provided, the most straightforward method to allow users to switch between two visualizations is to use show/hide buttons.

Here's why each option is or isn't suitable for the requirement:

A). A parameter and a calculated field: While it's possible to use a parameter and a calculated field to control which visualization is displayed, it requires creating a calculated field that responds to a parameter and then using that field to filter the view. This method can become complex and is not as user-friendly for simply showing and hiding visualizations.

B). Worksheet actions: Worksheet actions in Tableau typically allow users to interact with the data within a visualization, such as filtering data or highlighting related data points when clicking or hovering. They are not designed to control the visibility of entire visualizations on a dashboard.

C). Show/hide buttons: Show/hide buttons are a feature specifically designed to manage the visibility of dashboard elements. When you create a show/hide button, it can be configured to display or hide a particular visualization, container, or any other dashboard element when clicked. This provides a very intuitive interface for users to switch between visualizations.

D). Dashboard actions: Dashboard actions, like worksheet actions, are used to create interactions between sheets, such as filtering data or navigating to other sheets or URLs based on user interactions. They are not intended for toggling the visibility of

visualizations.

Therefore, the correct answer is C. Show/hide buttons as they provide a user-friendly way to switch between visualizations on a dashboard without the need for complex calculations or actions that aren't meant for this purpose. The show/hide button feature is specifically designed for toggling visibility and offers a simple and effective solution for the requirement.

NEW QUESTION # 52

You create the following story that contains two story point.

You want to change the story point format to show the current story point number out of the total number of story points.

Which Layout option should you use?

- A. Arrows only
- B. Caption boxes
- **C. Numbers**
- D. Dots

Answer: C

Explanation:

To change the story point format to show the current story point number out of the total number of story points, you should use the Numbers option in the Layout tab. This option will display the story points as numbers in a horizontal or vertical sequence, such as 1/2, 2/2. You can also choose to show or hide the next and previous arrows for navigation. The Numbers option will help you indicate the progress and order of your story points more clearly than the other options. Reference:

NEW QUESTION # 53

You receive a tab-delimited data file name sales.tsv.

You need to connect to the file.

Which option should you select in Tableau Desktop?

Answer:

Explanation:

To connect to a tab-delimited data file named sales.tsv, you should select the option To a File > Text file in Tableau Desktop. This option will allow you to browse and select the file from your local or network drive and connect to it as a data source. You can then specify the text file properties, such as the delimiter, the text qualifier, and whether the first row contains column names. You can also join, union, or blend the data with other data sources if needed. References:
