ISA/IEC 62443 Cybersecurity Fundamentals Specialist Sample Questions (Q79-Q84):

NEW QUESTION # 79

Which of the following technologies is no longer considered secure?

- A. Advanced Encryption Standard (AES)
- B. Transport Layer Security (TLS)
- C. **Secure Sockets Layer (SSL)**
- D. Digital Encryption Standard (DES)

Answer: C

Explanation:

Secure Sockets Layer (SSL) is no longer considered secure due to known vulnerabilities and cryptographic weaknesses. Modern standards require the use of newer versions of Transport Layer Security (TLS), and similarly, DES is deprecated for strong security. However, the best and most universally referenced example is SSL, as major industry and regulatory bodies recommend disabling SSL entirely in favor of TLS 1.2 or above.

Reference: ISA/IEC 62443-3-3:2013, Section 4.2.3.7 ("Cryptographic protections"); NIST SP 800-52 Rev. 2.

NEW QUESTION # 80

Which of the following is an industry sector-specific standard?

Available Choices (select all choices that are correct)

- A. NIST SP800-82
- B. ISA-62443 (EC 62443)
- C. ISO 27001
- D. **API 1164**

Answer: D

NEW QUESTION # 81

Why is it important to document the results of the initial/high-level risk assessment?

- A. To reduce communication
- B. To skip future assessments
- C. To avoid stakeholder involvement
- D. **To establish a baseline**

Answer: D

Explanation:

Documenting the results of the initial or high-level risk assessment is crucial to establish a baseline for cybersecurity posture and risk. This baseline serves as a reference for tracking progress, justifying future investments, measuring improvements, and supporting subsequent detailed risk assessments. It also aids in communication with stakeholders and auditors.

Reference: ISA/IEC 62443-2-1:2009, Section 5.2.3 ("Documenting results and baseline"); ISA/IEC 62443-3-2:2020, Section 4.3.4.

NEW QUESTION # 82

Which of the following activities is NOT listed under the "Patch Testing" phase in the asset owner requirements?

- A. File authenticity
- B. Notification
- **C. Removal procedure**
- D. Qualification and verification

Answer: C

Explanation:

According to ISA/IEC 62443-2-3, patch testing involves several tasks to ensure the patch is safe and effective before deployment.

These include:

File authenticity verification

Notification of applicable systems/users

Qualification and verification testing

However, a "removal procedure" is not listed as a standard activity under patch testing - although rollback planning might be a best practice, it is not specifically listed in the test phase.

"Patch testing activities include verification of patch authenticity, notification to relevant stakeholders, and qualification testing in a representative environment."

NEW QUESTION # 83

Which of the following starts at a high level and includes all ANSI/ISA-95 Level 0,1,2,3,4 equipment and information systems?

- A. Asset model
- B. Zone model
- C. Reference architecture
- **D. Reference model**

Answer: D

Explanation:

The reference model described in ISA/IEC 62443-1-1 (see Figure 2) starts at a high level and encompasses all levels of the ISA-95 model (Levels 0 to 4), which range from field devices up to business logistics systems.

This model provides a holistic, layered view of all the equipment, systems, and information flows in industrial automation.
