

Professional-Cloud-Developer Latest Test Practice & ExamDumpsVCE - Leader in Certification Exam Materials & Google Google Certified Professional - Cloud Developer

P.S. Free 2026 Google Professional-Cloud-Developer dumps are available on Google Drive shared by ExamDumpsVCE: https://drive.google.com/open?id=16luZ6SWes4avF_dCzmTvP1t-D2VSvNFj

You don't need to worry about wasting your precious time but failing to get the Professional-Cloud-Developer certification. Many people have used our study materials and the pass rate of the exam is 99%. This means as long as you learn with our study materials, you will pass the Professional-Cloud-Developer exam without doubt. If any incident happens and you don't pass the Professional-Cloud-Developer Exam, we will give you a full refund. Our sincerity stems from the good quality of our products. We will give you one year's free update of the exam study materials. Now just make up your mind and get your Professional-Cloud-Developer exam torrent!

Google Professional-Cloud-Developer exam is an essential certification for developers who want to demonstrate their expertise in developing applications on Google Cloud Platform. Google Certified Professional - Cloud Developer certification exam covers various topics related to Google Cloud Platform, and passing the exam is a great way for developers to advance their careers. As the demand for developers with expertise in Google Cloud Platform continues to grow, the Google Professional-Cloud-Developer certification is becoming increasingly valuable.

Difficulty in writing the Google Professional Cloud Developer Exam

Believe you must have decided to appear for the Google Cloud Developer Certifications, This is one of the most toughest exam

conducted by the Google, if you are not from a development background and trying to appear for this exam and then this exam would go very hard for you to crack it down, still if you had done your homework properly and prepared through Google docs, Exam questions practice then definitely you will be able to nail down this exam.

There are many websites that are offering the latest Google Professional Cloud Developer questions and answers but these questions are not verified by Google certified experts and that's why many are failed in their first attempt. ExamDumpsVCE is the best platform which provides the candidate with the necessary Google Professional Cloud Developer exam questions that will help him to pass the Google Professional Cloud Developer on the first time. Candidate will not have to take the Google Professional Cloud Developer twice because with the help of **Google Professional Cloud Developer exam dumps** Candidate will have every valuable material required to pass the Google Professional Cloud Developer. We are providing the latest and actual questions and that is the reason why this is the one that he needs to use and there are no chances to fail when a candidate will have valid exam dumps from ExamDumpsVCE. We have the guarantee that the questions that we have will be the ones that will pass candidate in the Google Professional Cloud Developer in the very first attempt.

Google Professional-Cloud-Developer Exam is designed to test the candidate's proficiency in developing and implementing cloud-based solutions on the Google Cloud Platform. Professional-Cloud-Developer exam is ideal for individuals who have experience in programming languages like Java, Python, and Node.js, and who wish to enhance their skills and knowledge in cloud computing. Google Certified Professional - Cloud Developer certification demonstrates the candidate's proficiency in developing cloud-based applications on the Google Cloud Platform and is a valuable asset for their career growth.

Google Professional-Cloud-Developer Latest Test Practice Exam Pass For Sure | Professional-Cloud-Developer: Google Certified Professional - Cloud Developer

Professional-Cloud-Developer exam dumps allow free trial downloads. You can get the information you want to know through the trial version. After downloading our study materials trial version, you can also easily select the version you like, as well as your favorite Professional-Cloud-Developer Exam Prep, based on which you can make targeted choices. Our study materials want every user to understand the product and be able to really get what they need.

Google Certified Professional - Cloud Developer Sample Questions (Q396-Q401):

NEW QUESTION # 396

You work for an ecommerce company. You are developing a new application with the following requirements:

- The application must have access to the most up-to-date data at all times.
- Due to company policy, data older than 30 days must be automatically deleted.

You need to determine which service should host the database, and how to configure the data deletion. You want to use the most efficient solution. What should you do?

- A. Configure Bigtable to host the database. Create a time-to-live policy that deletes data older than 30 days.
- **B. Configure Bigtable to host the database. Create a garbage collection policy in Bigtable that deletes data older than 30 days.**
- C. Configure Spanner to host the database. Use Data Catalog to delete data older than 30 days.
- D. Configure Spanner to host the database. Create a time-to-live (TTL) policy that deletes data older than 30 days.

Answer: B

Explanation:

Bigtable is a highly scalable, NoSQL database that supports efficient time-to-live (TTL) policies through garbage collection. By configuring a garbage collection policy, you can automatically delete data older than 30 days, ensuring compliance with the company's data retention policy without additional management overhead.

Using Spanner would be less efficient for this use case, as it is a relational database designed for strong consistency, not for simple TTL-based data expiry. Bigtable's TTL feature with garbage collection is optimized for NoSQL data with automated, policy-driven deletions, making it the most efficient choice for your requirements.

NEW QUESTION # 397

You plan to make a simple HTML application available on the internet. This site keeps information about FAQs for your application. The application is static and contains images, HTML, CSS, and Javascript. You want to make this application available on the internet with as few steps as possible.

What should you do?

- A. Create a Compute Engine instance with Apache web server installed. Configure Apache web server to host the application.
- **B. Upload your application to Cloud Storage.**
- C. Containerize your application first. Deploy this container to Google Kubernetes Engine (GKE) and assign an external IP address to the GKE pod hosting the application.
- D. Upload your application to an App Engine environment.

Answer: B

Explanation:

NEW QUESTION # 398

Case Study 2 - HipLocal

Company Overview

HipLocal is a community application designed to facilitate communication between people in close proximity. It is used for event planning and organizing sporting events, and for businesses to connect with their local communities. HipLocal launched recently in a few neighborhoods in Dallas and is rapidly growing into a global phenomenon. Its unique style of hyper-local community communication and business outreach is in demand around the world.

Executive Statement

We are the number one local community app; it's time to take our local community services global. Our venture capital investors want to see rapid growth and the same great experience for new local and virtual communities that come online, whether their members are 10 or 10000 miles away from each other.

Solution Concept

HipLocal wants to expand their existing service, with updated functionality, in new regions to better serve their global customers. They want to hire and train a new team to support these regions in their time zones. They will need to ensure that the application scales smoothly and provides clear uptime data, and that they analyze and respond to any issues that occur.

Existing Technical Environment

HipLocal's environment is a mix of on-premises hardware and infrastructure running in Google Cloud Platform. The HipLocal team understands their application well, but has limited experience in global scale applications. Their existing technical environment is as follows:

- Existing APIs run on Compute Engine virtual machine instances hosted in GCP.
- State is stored in a single instance MySQL database in GCP.
- Release cycles include development freezes to allow for QA testing.
- The application has no logging.
- Applications are manually deployed by infrastructure engineers during periods of slow traffic on weekday evenings.
- There are basic indicators of uptime; alerts are frequently fired when the APIs are unresponsive.

Business Requirements

HipLocal's investors want to expand their footprint and support the increase in demand they are seeing. Their requirements are:

- Expand availability of the application to new regions.
- Support 10x as many concurrent users.
- Ensure a consistent experience for users when they travel to different regions.
- Obtain user activity metrics to better understand how to monetize their product.
- Ensure compliance with regulations in the new regions (for example, GDPR).
- Reduce infrastructure management time and cost.
- Adopt the Google-recommended practices for cloud computing.

Develop standardized workflows and processes around application lifecycle management.

Define service level indicators (SLIs) and service level objectives (SLOs).

Technical Requirements

- Provide secure communications between the on-premises data center and cloud-hosted applications and infrastructure.
- The application must provide usage metrics and monitoring.
- APIs require authentication and authorization.

- Implement faster and more accurate validation of new features.
- Logging and performance metrics must provide actionable information to be able to provide debugging information and alerts.
- Must scale to meet user demand.

For this question refer to the HipLocal case study.

HipLocal wants to reduce the latency of their services for users in global locations. They have created read replicas of their database in locations where their users reside and configured their service to read traffic using those replicas. How should they further reduce latency for all database interactions with the least amount of effort?

- **A. Migrate the database to Cloud Spanner and use it to serve all global user traffic.**
- B. Migrate the database to Bigtable and use it to serve all global user traffic.
- C. Migrate the database to Firestore in Datastore mode and use it to serve all global user traffic.
- D. Migrate the services to Google Kubernetes Engine and use a load balancer service to better scale the application.

Answer: A

NEW QUESTION # 399

You are a developer at a large organization. Your team uses Git for source code management (SCM). You want to ensure that your team follows Google-recommended best practices to manage code to drive higher rates of software delivery. Which SCM process should your team use?

- A. Each group of developers copies the repository, commits their changes to their repository, and merges their code into the main repository before each product release.
- B. Each developer creates a branch for their own work, commits their changes to their branch, and merges their code into the main branch daily.
- **C. Each group of developers creates a feature branch from the main branch for their work, commits their changes to their branch, and merges their code into the main branch after the change advisory board approves it.**
- D. Each developer commits their code to the main branch before each product release, conducts testing, and rolls back if integration issues are detected.

Answer: C

Explanation:

Use a centralized repository. A centralized repository is a single location where all of your team's code is stored. This makes it easy for everyone to access the latest code, and it also helps to prevent conflicts.

Use branches. Branches are a way to create a separate version of the code for development purposes. This allows developers to work on new features or bug fixes without affecting the main branch of the code.

NEW QUESTION # 400

You are designing a chat room application that will host multiple rooms and retain the message history for each room. You have selected Firestore as your database. How should you represent the data in Firestore?

- **A. Create a collection for the rooms. For each room, create a document that contains a collection for documents, each of which contains a message.**
-
- B. Create a collection for the rooms. For each room, create a document that lists the contents of the messages
-
- C. Create a collection for the rooms. For each room, create a collection that contains a document for each message
-
- D. Create a collection for the rooms, and create a document for each room. Create a separate collection for messages, with one document per message. Each room's document contains a list of references to the messages.
-

Answer: A

Explanation:
