Latest Amazon AWS-Solutions-Architect-Associate Dumps are here to help you to pass your Amazon Certification exam with ValidBraindumps' valid, real, and updated AWS-Solutions-Architect-Associate Exam Questions with passing guarantee. The Amazon AWS-Solutions-Architect-Associate certification is a valuable certificate that is designed to advance the professional career. With the AWS Certified Solutions Architect - Associate (SAA-C03) (AWS-Solutions-Architect-Associate) certification exam seasonal professionals and beginners get an opportunity to demonstrate their expertise. The AWS Certified Solutions Architect - Associate (SAA-C03) exam recognizes successful candidates in the market and provides solid proof of their expertise.

The AWS-Solutions-Architect-Associate exam tests an individual's knowledge and skills in various areas related to AWS, such as designing and deploying scalable, highly available, and fault-tolerant systems, selecting the right AWS services for a given situation, migrating on-premises workloads to AWS, and managing and monitoring AWS resources. AWS-Solutions-Architect-Associate Exam also covers topics such as security, cost optimization, and troubleshooting.

AWS-Solutions-Architect-Associate Exam Introduction - Latest AWS-Solutions-Architect-Associate Real Test

Owing to the industrious dedication of our experts and other working staff, our AWS-Solutions-Architect-Associate study materials grow to be more mature and are able to fight against any difficulties. Our AWS-Solutions-Architect-Associate preparation exam have achieved high pass rate in the industry, and we always maintain a 99% pass rate on our AWS-Solutions-Architect-Associate Exam Questions with our endless efforts. We have to admit that behind such a startling figure, there embrace mass investments from our company. Since our company's establishment, we have devoted mass manpower, materials and financial resources into AWS-Solutions-Architect-Associate exam materials.

Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q91-Q96):

NEW QUESTION # 91

A company needs to monitor the read and write IOPs metrics for their AWS MySQL RDS instances and send real-time alerts to their operations team. Which AWS services can accomplish this?

Choose 2 answers

- A. Amazon Route 53
- B. Amazon CloudWatch
- C. Amazon Simple Email Service

- D. Amazon Simple Notification Service
- E. Amazon Simple Queue Service

Answer: B,D

NEW QUESTION # 92

A solutions architect is designing the cloud architecture for a new application being deployed on AWS. The process should run in parallel while adding and removing application nodes as needed based on the number of jobs to be processed. The processor application is stateless. The solutions architect must ensure that the application is loosely coupled and the job items are durably stored. Which design should the solutions architect use?

- A. Create an Amazon SNS topic to send the jobs that need to be processed. Create an Amazon Machine Image (AMI) that consists of the processor application. Create a launch template that uses the AMI. Create an Auto Scaling group using the launch template. Set the scaling policy for the Auto Scaling group to add and remove nodes based on the number of messages published to the SNS topic.
- B. Create an Amazon SNS topic to send the jobs that need to be processed. Create an Amazon Machine Image (AMI) that consists of the processor application. Create a launch configuration that uses the AMI. Create an Auto Scaling group using the launch configuration. Set the scaling policy for the Auto Scaling group to add and remove nodes based on CPU usage.
- C. Create an Amazon SQS queue to hold the jobs that need to be processed. Create an Amazon Machine Image (AMI) that consists of the processor application. Create a launch configuration that uses the AMI. Create an Auto Scaling group using the launch configuration. Set the scaling policy for the Auto Scaling group to add and remove nodes based on network usage.
- D. Create an Amazon SQS queue to hold the jobs that need to be processed. Create an Amazon Machine Image (AMI) that consists of the processor application. Create a launch template that uses the AMI. Create an Auto Scaling group using the launch template. Set the scaling policy for the Auto Scaling group to add and remove nodes based on the number of items in the SQS queue.

Answer: D

NEW QUESTION # 93

A company has a highly dynamic batch processing job that uses many Amazon EC2 instances to complete it. The job is stateless in nature, can be started and stopped at any given time with no negative impact, and typically takes upwards of 60 minutes total to complete. The company has asked a solutions architect to design a scalable and cost-effective solution that meets the requirements of the job. What should the solutions architect recommend?

- A. Implement the processing on AWS Lambda
- B. Implement EC2 Spot Instances
- C. Purchase EC2 Reserved Instances
- D. Implement EC2 On-Demand Instances

Answer: B

Explanation:

Explanation

EC2 Spot Instances allow users to bid on spare Amazon EC2 computing capacity and can be a cost-effective solution for stateless, interruptible workloads that can be started and stopped at any time. Since the batch processing job is stateless, can be started and stopped at any time, and typically takes upwards of 60 minutes to complete, EC2 Spot Instances would be a good fit for this workload.

NEW QUESTION # 94

At part of budget planning, management wants a report of AWS billed items listed by user. The data will be used to create department budgets. A solution architect needs to determine the most efficient way to obtain this report information. Which solution meets these requirements?

- A. Access the bill details from the billing dashboard and download via bill.
- B. Run a query with Amazon Athena to generate the report.
- C. Create a report in Cost Explorer and download the report.

- D. Modify a cost budget in AWS Budgets to alert with Amazon Simple Email Service (Amazon SES).

Answer: C

Explanation:

This option is the most efficient because it uses Cost Explorer, which is a tool that allows you to visualize, understand, and manage your AWS costs and usage over time¹. You can create a report in Cost Explorer that lists AWS billed items by user, using the user name tag as a filter². You can then download the report as a CSV file and use it for budget planning. Option A is less efficient because it uses Amazon Athena, which is a serverless interactive query service that allows you to analyze data in Amazon S3 using standard SQL³. You would need to set up an Athena table that points to your AWS Cost and Usage Report data in S3, and then run a query to generate the report. This would incur additional costs and complexity. Option C is less efficient because it uses the billing dashboard, which provides a high-level summary of your AWS costs and usage.

You can access the bill details from the billing dashboard and download them via bill, but this would not list the billed items by user.

You would need to use tags to group your costs by user name, which would require additional steps. Option D is less efficient because it uses AWS Budgets, which is a tool that allows you to plan your service usage, service costs, and instance reservations.

You can modify a cost budget in AWS Budgets to alert with Amazon Simple Email Service (Amazon SES), but this would not generate a report of AWS billed items by user. This would only notify you when your actual or forecasted costs exceed or are expected to exceed your budgeted amount.

NEW QUESTION # 95

A hospital wants to create digital copies for its large collection of historical written records. The hospital will continue to add hundreds of new documents each day. The hospital's data team will scan the documents and will upload the documents to the AWS Cloud.

A solutions architect must implement a solution to analyze the documents: extract the medical information, and store the documents so that an application can run SQL queries on the data. The solution must maximize scalability and operational efficiency. Which combination of steps should the solutions architect take to meet these requirements? (Select TWO.)

- A. Create an Auto Scaling group of Amazon EC2 instances to run a custom application that processes the scanned files and extracts the medical information.
- **B. Write the document information to an Amazon EC2 instance that runs a MySQL database**
- C. Write the document information to an Amazon S3 bucket. Use Amazon Athena to query the data.
- D. Create an AWS Lambda function that runs when new documents are uploaded. Use Amazon Rekognition to convert the documents to raw text. Use Amazon Transcribe Medical to detect and extract relevant medical information from the text.
- **E. Create an AWS Lambda function that runs when new documents are uploaded. Use Amazon Textract to convert the documents to raw text. Use Amazon Comprehend Medical to detect and extract relevant medical information from the text.**

Answer: B,E

NEW QUESTION # 96

.....

Our company attaches great importance on improving the AWS-Solutions-Architect-Associate study prep. In addition, we clearly know that constant improvement is of great significance to the survival of a company. The fierce competition in the market among the same industry has long existed. As for our AWS-Solutions-Architect-Associate exam braindump, our company masters the core technology, owns the independent intellectual property rights and strong market competitiveness. What is more, we have never satisfied our current accomplishments. The highest record is up to five seconds. There has no delay time of the grading process. Slow system response doesn't exist. In addition, the calculation system of the AWS-Solutions-Architect-Associate Test Question is very powerful and stable. We promise that the results of your exercises are accurate.
