ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q360-Q365):

NEW QUESTION # 360

Which of the following statements about how different types of test tools support testers is true?

- A. The support offered by a test data preparation tool is often leveraged by testers to run automated regression test suites
- B. The support offered by a continuous integration tool is often leveraged by testers to automatically generate test cases from a model

- C. The support offered by a performance testing tool is often leveraged by testers to run load tests
- D. The support offered by a bug prediction tool is often used by testers to track the bugs they found

Answer: C

Explanation:

The support offered by a performance testing tool is often leveraged by testers to run load tests, which are tests that simulate a large number of concurrent users or transactions on the system under test, in order to measure its performance, reliability, and scalability. Performance testing tools can help testers to generate realistic workloads, monitor system behavior, collect and analyze performance metrics, and identify performance bottlenecks. The other statements are false, because:

* A test data preparation tool is a tool that helps testers to create, manage, and manipulate test data, which are the inputs and outputs of test cases. Test data preparation tools are not directly related to running automated regression test suites, which are test suites that verify that the system still works as expected after changes or modifications. Regression test suites are usually executed by test execution tools, which are tools that can automatically run test cases and compare actual results with expected results.

* A bug prediction tool is a tool that uses machine learning or statistical techniques to predict the likelihood of defects in a software system, based on various factors such as code complexity, code churn, code coverage, code smells, etc. Bug prediction tools are not used by testers to track the bugs they found, which are the actual defects that have been detected and reported during testing. Bugs are usually tracked by defect management tools, which are tools that help testers to record, monitor, analyze, and resolve defects.

* A continuous integration tool is a tool that enables the integration of code changes from multiple developers into a shared repository, and the execution of automated builds and tests, in order to ensure the quality and consistency of the software system. Continuous integration tools are not used by testers to automatically generate test cases from a model, which are test cases that are derived from a representation of the system under test, such as a state diagram, a decision table, a use case, etc. Test cases can be automatically generated by test design tools, which are tools that support the implementation and maintenance of test cases, based on test design specifications or test models.

NEW QUESTION # 361

Consider the following list of activities (I to V):

- I . Test design
- II . Test planning
- III . Review test basis
- IV . Be a facilitator of a peer review
- V . Test monitoring and control

Which ONE of the following options identifies the activities that the test management role is MAINLY focused on?

- A. Activities I and V
- B. Activities II and V
- C. Activities I, III, and IV
- D. Activities III, IV, and V

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation:

Test management focuses on planning and control activities. Test planning (II) involves defining test strategies, schedules, and resources, while test monitoring and control (V) ensures that testing activities are aligned with objectives and tracked effectively. Other activities, such as test design (I) and peer review facilitation (IV), are typically handled by testers or test leads.

NEW QUESTION # 362

Which of the following statements about Experience Based Techniques (EBT) is correct?

- A. EBT is based on the ability of the test engineer to implement various testing techniques.
- B. EBT is done as a second stage of testing, after non-experienced-based testing took place.
- C. EBT require broad and deep knowledge in testing but not necessarily in the application or technological domain.
- D. EBT use tests derived from the test engineers' previous experience with similar technologies.

Answer: D

Explanation:

Experience based techniques (EBT) are techniques that use the knowledge, intuition and skills of the test engineers to design and execute tests. EBT use tests derived from the test engineers' previous experience with similar technologies, domains, applications or systems. EBT are not based on the ability of the test engineer to implement various testing techniques, but rather on their personal judgment and creativity. EBT are not done as a second stage of testing, after non-experience-based testing took place, but rather as a complementary or alternative approach to other techniques. EBT require broad and deep knowledge in both testing and the application or technological domain, as this can help the test engineer identify potential risks, scenarios or defects. Verified

NEW QUESTION # 363

Which ONE of the following options MOST ACCURATELY describes statement testing?

- A. In statement testing, the coverage items are decisions and statements. The aim is to design test cases that exercise statements in the code until an acceptable level of coverage is achieved, expressed as a percentage.
- B. In statement testing, the coverage items are branches, and the aim is to design test cases to exercise branches in the code until an acceptable level of coverage is achieved, expressed as a percentage.
- C. In statement testing, the coverage items are control flow transfers between branches. The aim is to design test cases to exercise branches in the code until an acceptable level of coverage is achieved, expressed as a percentage.
- **D. In statement testing, the coverage items are executable statements. The aim is to design test cases that exercise statements in the code until an acceptable level of coverage is achieved, expressed as a percentage.**

Answer: D

Explanation:

Comprehensive and Detailed In-Depth Explanation: Statement testing aims to execute every executable statement in the source code at least once.

* (D) is correct as statement testing ensures maximum statement execution.

* (A) describes branch testing, which focuses on flow transfers.

* (B) and (C) incorrectly mix decision testing and branch testing concepts.

NEW QUESTION # 364

As a result of the joint evaluation of a product version with the customer, it has been concluded that it would be appropriate to retrieve an earlier version of the product and carry out a benchmark. Depending on the result, further development will be carried out based on the current version or the retrieved version.

Which mechanism, process, and/or technique will allow the specific version (including the testing work products) of a given software product to be restored?

- A. Risk management
- B. Change management
- **C. Configuration management**
- D. Defect management

Answer: C

Explanation:

Comprehensive and Detailed In-Depth Explanation: Configuration management (B) ensures that versions of software and test artifacts are properly tracked, stored, and retrievable. It allows teams to:

* Restore earlier versions of software and test work products

* Maintain traceability between requirements, tests, and code

* Avoid discrepancies due to mismanaged versions

* (A) is incorrect because defect management tracks issues but does not restore versions.

* (C) is incorrect because change management controls changes but does not track past versions.

* (D) is incorrect because risk management assesses risks but does not manage software versions.

Effective configuration management ensures the ability to roll back changes and maintain system stability.
