

Data-Architect New Dumps Questions & Data-Architect Valid Test Registration

P.S. Free 2026 Salesforce Data-Architect dumps are available on Google Drive shared by Exams-boost:
<https://drive.google.com/open?id=1IPcc3diuvKV9OG4LtFVNEcZT8n85sKc>

After clients pay for our Data-Architect exam torrent successfully, they will receive the mails sent by our system in 5-10 minutes. Then the client can click the links and download and then you can use our Data-Architect questions torrent to learn. Because time is very important for the people who prepare for the exam, the client can download immediately after paying is the great advantage of our Data-Architect Guide Torrent.

Salesforce Certified Data Architect exam covers a wide range of topics, including data modeling, database design, data migration, data integration, data security, and data governance. It is designed to test the candidate's knowledge and skills in developing robust and scalable data architectures that meet the needs of modern businesses. Data-Architect exam also evaluates the candidate's ability to work with various Salesforce data tools and technologies, such as Salesforce Data Loader, Salesforce Connect, and Salesforce Shield.

Salesforce Certified Data Architect exam is a challenging and comprehensive test that evaluates a candidate's expertise in various areas of data architecture. Data-Architect Exam covers topics such as data modeling, data integration, data governance, data security, data migration, and data quality. Data-Architect exam consists of 60 multiple-choice questions and has a duration of 120 minutes. A passing score of 70% or higher is required to obtain the certification.

Free Salesforce Data-Architect Questions [2026] – Fully Updated

There are totally three versions of Data-Architect practice materials which are the most suitable versions for you: PDF, Software and APP online versions. We promise ourselves and exam candidates to make these Data-Architect learning materials top notch. So if you are in a dark space, our Data-Architect Exam Questions can inspire you make great improvements. Just believe in our Data-Architect training guide and let us lead you to a brighter future!

Salesforce Certified Data Architect Sample Questions (Q188-Q193):

NEW QUESTION # 188

Northern Trail Outfitters (NTO) wants to start a loyalty program to reward repeat customers. The program will track every item a customer has bought and grants them points for discounts. The following conditions will exist upon implementation:

Data will be used to drive marketing and product development initiatives.

NTO estimates that the program will generate 100 million rows of data monthly.

NTO will use Salesforce's Einstein Analytics and Discovery to leverage their data and make business and marketing decisions.

What should the Data Architect do to store, collect, and use the reward program data?

- A. Create a big object in Einstein Analytics to capture the Loyalty Program data.

- B. Have Einstein connect to the point of sales system to capture the Reward Program data.
- C. Create a custom object in Salesforce that will be used to capture the Reward Program data.
- **D. Create a custom big object in Salesforce which will be used to capture the Reward Program data for consumption by Einstein.**

Answer: D

Explanation:

According to the official Salesforce guide¹, big objects are designed to store and manage massive data volumes within Salesforce without affecting performance. They can be queried by using Async SOQL or standard SOQL, and they can be accessed by using Apex, Visualforce, Lightning components, or APIs. Big objects are ideal for storing data that is used for analytics or reporting purposes, such as the reward program data. Option A is the correct answer because it allows NTO to create a custom big object in Salesforce that can store the reward program data and make it available for consumption by Einstein Analytics and Discovery. Option B is incorrect because Einstein cannot connect directly to the point of sales system to capture the reward program data. Option C is incorrect because Einstein Analytics does not support creating big objects. Option D is incorrect because custom objects are not suitable for storing large volumes of data.

NEW QUESTION # 189

Universal Containers (UC) has over 10 million accounts with an average of 20 opportunities with each account. A Sales Executive at UC needs to generate a daily report for all opportunities in a specific opportunity stage.

Which two key considerations should be made to make sure the performance of the report is not degraded due to large data volume?

- A. Number of characters in report query.
- **B. Number of records returned by report query.**
- C. Number of queries running at a time.
- **D. Number of joins used in report query.**

Answer: B,D

Explanation:

The number of joins used in report query and the number of records returned by report query are two key considerations to make sure the performance of the report is not degraded due to large data volume. The number of joins used in report query affects the complexity and execution time of the query, especially when joining multiple large objects⁴. The number of records returned by report query affects the amount of data that needs to be processed and displayed by the report engine.

NEW QUESTION # 190

UC is building a salesforce application to track contacts and their respective conferences that they have attended with the following requirements:

1. Contacts will be stored in the standard contact object.
2. Conferences will be stored in a custom conference_c object.
3. Each contact may attend multiple conferences and each conference may be related to multiple contacts.

How should a data architect model the relationship between the contact and conference objects?

- A. Create a master detail relationship field on the Conference object.
- **B. Implement a Contact Conference junction object with master detail relationship to both contact and conference_c**
- C. Create a lookup relationship field on contact object.
- D. Create a master detail relationship field on the Contact object.

Answer: B

NEW QUESTION # 191

A large retail B2C customer wants to build a 360 view of its customer for its call center agents. The customer interaction is currently maintained in the following system:

1. Salesforce CRM
3. Customer Master Data management (MDM)
4. Contract Management system

5. Marketing solution

What should a data architect recommend that would help upgrade uniquely identify customer across multiple systems:

- A. Create a custom object that will serve as a cross reference for the customer id.
- B. Store the salesforce id in all the solutions to identify the customer.
- C. Create a customer data base and use this id in all systems.
- **D. Create a custom field as external id to maintain the customer Id from the MDM solution.**

Answer: D

Explanation:

To help uniquely identify customer across multiple systems, a data architect should recommend creating a custom field as external ID to maintain the customer ID from the MDM solution. An external ID is a custom field that has the "External ID" attribute enabled, which means that it contains unique record identifiers from a system outside of Salesforce. By using the customer ID from the MDM solution as an external ID in Salesforce CRM, Contract Management system, and Marketing solution, the data architect can ensure that each customer can be easily identified and integrated across these systems. Option A is incorrect because storing the Salesforce ID in all the solutions to identify the customer will not work if the customer records are created or updated in other systems besides Salesforce CRM. Option B is incorrect because creating a custom object that will serve as a cross reference for the customer ID will require additional configuration effort and may not be consistent with the actual customer records in each system. Option C is incorrect because creating a customer database and using this ID in all systems will require additional infrastructure cost and maintenance effort.

NEW QUESTION # 192

A company has 12 million records, and a nightly integration queries these records.

Which two areas should a Data Architect investigate during troubleshooting if queries are timing out? (Choose two.)

- A. Modify the integration users' profile to have View All Data.
- B. Create a formula field instead of having multiple filter criteria.
- **C. Create custom indexes on the fields used in the filter criteria.**
- **D. Make sure the query doesn't contain NULL in any filter criteria.**

Answer: C,D

Explanation:

Making sure the query does not contain NULL in any filter criteria can avoid full table scans and leverage indexes more efficiently. Queries with NULL filters are not selective and can cause performance issues. Creating custom indexes on the fields used in the filter criteria can also enhance the query performance by reducing the number of records to scan.

NEW QUESTION # 193

.....

Our company employs experts in many fields to write Data-Architect study guide, so you can rest assured of the quality of our learning materials. What's more, preparing for the exam under the guidance of our Data-Architect exam questions, you will give you more opportunities to be promoted and raise your salary in the near future. So when you are ready to take the exam, you can rely on our Data-Architect Learning Materials. If you want to be the next beneficiary, what are you waiting for? Come and buy our Data-Architect learning materials.
