Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q20-Q25):

NEW QUESTION # 20

A company is running its production and nonproduction environment workloads in multiple AWS accounts. The accounts are in an organization in AWS Organizations. The company needs to design a solution that will prevent the modification of cost usage tags. Which solution will meet these requirements?

- A. Create custom Amazon CloudWatch logs to prevent tag modification.
- B. Create a custom AWS Config rule to prevent tag modification except by authorized principals.
- C. Create a service control policy (SCP) to prevent tag modification except by authorized principals.
- D. Create a custom trail in AWS CloudTrail to prevent tag modification

Answer: C

Explanation:

This solution meets the requirements because it uses SCPs to restrict the actions that can be performed on cost usage tags in the organization. SCPs are a type of organization policy that you can use to manage permissions in your organization. SCPs specify the

maximum permissions for an organization, organizational unit (OU), or account. You can use SCPs to enforce consistent tag policies across your organization and prevent unauthorized or accidental changes to your tags. You can also create exceptions for authorized principals, such as administrators or auditors, who need to modify tags for legitimate purposes.

NEW QUESTION # 21

An image-processing company has a web application that users use to upload images. The application uploads the images into an Amazon S3 bucket. The company has set up S3 event notifications to publish the object creation events to an Amazon Simple Queue Service (Amazon SQS) standard queue. The SQS queue serves as the event source for an AWS Lambda function that processes the images and sends the results to users through email.

Users report that they are receiving multiple email messages for every uploaded image. A solutions architect determines that SQS messages are invoking the Lambda function more than once, resulting in multiple email messages.

What should the solutions architect do to resolve this issue with the LEAST operational overhead?

- A. Change the SQS standard queue to an SQS FIFO queue. Use the message deduplication ID to discard duplicate messages.
- B. Set up long polling in the SQS queue by increasing the ReceiveMessage wait time to 30 seconds.
- C. Modify the Lambda function to delete each message from the SQS queue immediately after the message is read before processing.
- D. Increase the visibility timeout in the SQS queue to a value that is greater than the total of the function timeout and the batch window timeout.

Answer: D

NEW QUESTION # 22

A Solutions Architect is unable to connect to the newly deployed EC2 instance via SSH using a home computer. However, the Architect was able to successfully access other existing instances in the VPC without any issues.

Which of the following should the Architect check and possibly correct to restore connectivity?

- A. Configure the Security Group of the EC2 instance to permit ingress traffic over port 22 from your IP.
- B. Use Amazon Data Lifecycle Manager.
- C. Configure the Security Group of the EC2 instance to permit ingress traffic over port 3389 from your IP.
- D. Configure the Network Access Control List of your VPC to permit ingress traffic over port 22 from your IP.

Answer: A

Explanation:

When connecting to your EC2 instance via SSH, you need to ensure that port 22 is allowed on the security group of your EC2 instance.

A security group acts as a virtual firewall that controls the traffic for one or more instances. When you launch an instance, you associate one or more security groups with the instance. You add rules to each security group that allow traffic to or from its associated instances. You can modify the rules for a security group at any time; the new rules are automatically applied to all instances that are associated with the security group.

Using Amazon Data Lifecycle Manager is incorrect because this is primarily used to manage the lifecycle of your AWS resources and not to allow certain traffic to go through.

Configuring the Network Access Control List of your VPC to permit ingress traffic over port 22 from your IP is incorrect because this is not necessary in this scenario as it was specified that you were able to connect to other EC2 instances. In addition, Network ACL is much suitable to control the traffic that goes in and out of your entire VPC and not just on one EC2 instance.

Configure the Security Group of the EC2 instance to permit ingress traffic over port 3389 from your IP is incorrect because this is relevant to RDP and not SSH.

NEW QUESTION # 23

A global company hosts its web application on Amazon EC2 instances behind an Application Load Balancer (ALB). The web application has static data and dynamic data. The company stores its static data in an Amazon S3 bucket. The company wants to improve performance and reduce latency for the static data and dynamic data. The company is using its own domain name registered with Amazon Route 53.

What should a solutions architect do to meet these requirements?

- A. Create an Amazon CloudFront distribution that has the S3 bucket and the ALB as origins Configure Route 53 to route traffic to the CloudFront distribution.
- B. Create an Amazon CloudFront distribution that has the ALB as an origin Create an AWS Global Accelerator standard accelerator that has the S3 bucket as an endpoint. Configure Route 53 to route traffic to the CloudFront distribution.
- C. Create an Amazon CloudFront distribution that has the ALB as an origin C. Create an AWS Global Accelerator standard accelerator that has the S3 bucket as an endpoint Create two domain names. Point one domain name to the CloudFront DNS name for dynamic content, Point the other domain name to the accelerator DNS name for static content Use the domain names as endpoints for the web application.
- D. Create an Amazon CloudFront distribution that has the S3 bucket as an origin Create an AWS Global Accelerator standard accelerator that has the ALB and the CloudFront distribution as endpoints Create a custom domain name that points to the accelerator DNS name Use the custom domain name as an endpoint for the web application.

Answer: D

Explanation:

Static content can be cached at Cloud front Edge locations from S3 and dynamic content EC2 behind the ALB whose performance can be improved by Global Accelerator whose one endpoint is ALB and other Cloud front.

So with regards to custom domain name endpoint is web application is R53 alias records for the custom domain point to web application

NEW QUESTION # 24

A company is conducting an internal audit. The company wants to ensure that the data in an Amazon S3 bucket that is associated with the company's AWS Lake Formation data lake does not contain sensitive customer or employee data. The company wants to

discover personally identifiable information (PII) or financial information, including passport numbers and credit card numbers. Which solution will meet these requirements?

- A. Configure Amazon S3 Inventory on the S3 bucket. Configure Amazon Athena to query the inventory.
- B. Use Amazon S3 Select to run a report across the S3 bucket.
- **C. Configure Amazon Macie to run a data discovery job that uses managed identifiers for the required data types.**
- D. Configure AWS Audit Manager on the account. Select the Payment Card Industry Data Security Standards (PCI DSS) for auditing.

Answer: C

Explanation:

Amazon Macie is a fully managed data security and data privacy service that uses machine learning and pattern matching to discover and protect your sensitive data in AWS. Macie can run data discovery jobs that use managed identifiers for various types of PII or financial information, such as passport numbers and credit card numbers. Macie can also generate findings that alert you to potential issues or risks with your data. Reference: <https://docs.aws.amazon.com/macie/latest/userguide/macie-identifiers.html>
