100% Pass Quiz 2026 Appian ACD201 – Efficient Knowledge Points

Research indicates that the success of our highly-praised ACD201 test questions owes to our endless efforts for the easily operated practice system. Most feedback received from our candidates tell the truth that our ACD201 guide torrent implement good

practices, systems as well as strengthen our ability to launch newer and more competitive products. Accompanying with our ACD201 Exam Dumps, we educate our candidates with less complicated Q&A but more essential information, which in a way makes you acquire more knowledge and enhance your self-cultivation to pass the ACD201 exam.

Appian ACD201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Performance and Scalability: This section of the exam measures the skills of Appian Developers and covers designing performant components, building memory-efficient models, conducting database load and automated testing, analyzing server memory and logs for risks, and resolving performance concerns for end users.
Topic 2	<ul style="list-style-type: none">• Application Design and Development: This section of the exam measures the skills of Appian Developers and covers translating business requirements into user stories, building end-to-end applications, managing object security, applying design best practices, and ensuring user-centric experiences through proper UX design.
Topic 3	<ul style="list-style-type: none">• Data Management: This section of the exam measures the skills of Solution Architects and covers designing and documenting data models, recommending record types for optimization and security, working with relational data, and implementing complex models with supporting objects.
Topic 4	<ul style="list-style-type: none">• Advanced Appian Concepts: This section of the exam measures the skills of Solution Architects and covers creating and configuring authentication methods, setting up integration objects, designing APIs, evaluating smart services and plug-ins, and applying SSO mechanisms with SAML and LDAP.

Appian Senior Developer Sample Questions (Q69-Q74):

NEW QUESTION # 69

In reviewing the process model metrics of your application, you notice a process model with a completion rate of only 10%. What are two possible reasons for this low completion rate? (Choose two.)

- A. The process contains at least one User Input Task with no exceptions or escalations, and users do not complete the task.
- B. The days configured for archival or deletion is significantly higher than the other process models in your application.
- C. There are a high number of smart service nodes configured in the process model.
- D. There are a significant number of instances that are experiencing process errors, which are not being handled by the production support team.

Answer: A,D

Explanation:

Process errors that remain unhandled will stall instances; those instances never reach an end event, driving the completion rate down. User-input tasks without deadlines, exceptions, or escalations can sit indefinitely when users do not act, leaving instances in an active state and lowering the overall completion percentage.

NEW QUESTION # 70

You're developing a user input form for a financial services application.

One component of this form requires you to embed an external site (in the form of a URL) that can receive inputs from Appian and return updates as the user interacts with it.

What should you do?

- A. Use a component plug-in to achieve interaction with the embedded site, because this use case requires input-output or event parameters.
- B. Use the Appian out-of-the-box Web Content Component. It can display content from a URL and provide both additional inputs, or receive updates as the user interacts with the embedded site.
- C. Use an integration to achieve interaction with the embedded site while displaying information in the Appian out-of-the-box Web Content Component. That way you can refresh for updates and interact with the site.

Answer: A

Explanation:

A component plug-in is required because the standard Web Content Component in Appian only displays external sites and does not support direct two-way interaction or input/output event handling. A plug-in enables custom integration to allow input and receive updates as users interact with the embedded site.

NEW QUESTION # 71

You need to select a plug-in to meet a specific requirement and several plug-ins can do the job. What are three key factors to consider? (Choose three.)

- A. What is the size of the plug-in?
- **B. What are the limitations of the plug-in?**
- **C. Is the plug-in approved for use in the Cloud?**
- **D. What are the compatible Appian versions?**
- E. Who is the creator of the plug-in?
- F. Is the plug-in open source or proprietary?

Answer: B,C,D

Explanation:

Limitations of the plug-in help you understand constraints or potential issues that could impact your implementation.

Compatible Appian versions ensure the plug-in will work correctly in your current and future environments.

Cloud approval status is essential for Appian Cloud environments, as only approved plug-ins are permitted for deployment.

NEW QUESTION # 72

You're performing System Integration Testing on a client's application that integrates with an external system.

In this instance, you're testing the application's interactions with external integrations to ensure that data is being handled correctly between the two systems. However, this step has been done manually and is time-consuming.

What should you do to make this process more efficient?

- A. Utilize the Postman API Platform to test the integrations with the external system and Appian's web APIs through a defined set of test cases.
- B. Utilize Appian-Locust to develop and execute performance tests on the systems integrations by scripting a scenario where multiple users are interacting with the external systems simultaneously.
- **C. Utilize FitNesse for Appian to perform automated functional testing on the workflows that include integrated systems through a defined set of test cases.**

Answer: C

Explanation:

FitNesse for Appian is designed for automated functional testing of Appian workflows, including those that call external integrations. By building repeatable FitNesse test scripts that drive the end-to-end process, you can automatically verify that data is correctly sent to - and returned from - the external system each time, greatly reducing the manual effort of system-integration testing.

NEW QUESTION # 73

A view is created with the primary table PERSON and is joined using a left join with the APPOINTMENT table on the column "PERSON_ID". There is a one-to-many relationship between the PERSON and APPOINTMENT tables.

A Custom Data Type (CDT) and a data store entity have been created based on this view, with the primary key being "PERSON_ID".

Review the data presented in the PERSON and APPOINTMENT tables:

PERSON_ID PERSON_NAME

1101	John Doe
1102	Jane Doe
1103	Richard Doe

APPOINTMENT_ID PERSON_ID STATUS

428	1101	Completed
429	1102	Completed
430	1101	New
431	1103	Completed
432	1101	New
433	1102	New
434	1101	New

Which two statements are true when the following query entity is executed? (Choose two.)

```
alqueryEntity(  
  entity: cons!ABC_PERSON_APPOINTMENT_PERSON_DSE,  
  query: alquery(  
    logicalExpression: alqueryLogicalExpression(  
      operator: "AND",  
      filters: {  
        alqueryFilter(  
          field: "STATUS",  
          operator: "=",  
          value: "New"  
        ),  
        alqueryFilter(  
          field: "PERSON_ID",  
          operator: "=",  
          value: "1101"  
        )  
      }  
    ),  
    pagingInfo: alpagingInfo(  
      startIndex: 1,  
      batchSize: 1,  
      sort: alsortInfo(field: "PERSON_ID")  
    )  
  ),  
  fetchTotalCount: true()  
)
```

- A. result totalCount is 3
- B. Appian makes one more query to the database(other than the actual query to fetch the data) to get the totalCount based on the applied filters.
- C. result totalCount is 1
- D. Appian makes one more query to the database(other than the actual query to fetch the data) to get the totalCount based on the applied filters and paging info.

Answer: B,C

Appian makes an additional query to the database (other than the main query for data) to retrieve the totalCount when fetchTotalCount: true() is used.

The result totalCount is 1, as there is only one person (PERSON_ID 1101) being filtered, even though there are multiple "New" appointments for that person; with a CDT based on PERSON_ID as the primary key, only one row is counted per person.

NEW QUESTION # 74
