The SOA-C02 exam measures the ability of the candidate to design, deploy, and manage AWS systems. AWS Certified SysOps Administrator - Associate (SOA-C02) certification validates the knowledge and skills needed to manage and operate AWS services, including EC2, S3, RDS, VPC, and more. SOA-C02 Exam consists of 65 multiple-choice and multiple-response questions, and the candidate has 130 minutes to complete the test.

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q234-Q239):

NEW QUESTION # 234

A company runs databases on Amazon RDS for MySQL DB instances. The company must generate database backups every 12 hours for all the DB instances. The company must retain the backups for 5 years.

A SysOps administrator needs to develop an automated solution to generate and retain the database backups.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Configure an AWS Lambda function to call the RDS CreateDBSnapshot API operation every 12 hours. Copy the snapshots to Amazon S3. Set up an S3 Lifecycle policy to retain the snapshots for 5 years.
- B. Configure an Amazon EventBridge rule to call the RDS CreateDBSnapshot API operation. Set the backup frequency to 12 hours. Set the retention period to 5 years.
- C. Enable RDS automated backups. Set the backup frequency to 12 hours. Set the retention period to 5 years.
- **D. Use AWS Backup to create an automated backup job in Amazon RDS. Set the backup frequency to 12 hours. Set the retention period to 5 years.**

Answer: D

Explanation:

AWS Backup natively supports RDS, lets you schedule backups every 12 hours, and set retention to years (5 years here). RDS automated backups can't retain that long, so AWS Backup is the lowest-overhead way to meet both frequency and long-term retention.

NEW QUESTION # 235

A SysOps Administrator runs a web application that is using a microservices approach whereby different responsibilities of the application have been divided in a separate microservice running on a different Amazon EC2 instance. The administrator has been tasked with reconfiguring the infrastructure to support this approach.

How can the administrator accomplish this with the LEAST administrative overhead?

- A. Use Amazon CloudFront to rewrite the header based on the microservice and forward the request.
- B. Use Amazon CloudFront to log the URL and forward the request.
- C. Use a Network Load Balancer (NLB) and do path-based routing.
- **D. Use an Application Load Balancer (ALB) and do path-based routing.**

Answer: D

NEW QUESTION # 236

The company needs a solution to provide failover for a Single-AZ RDS for MySQL DB instance to minimize application downtime.

Options:

- A. Use RDS Proxy to configure a proxy in front of the DB instance.
- B. Add the DB instance to an Auto Scaling group that has a minimum capacity of 2 and a desired capacity of 2.
- **C. Modify the DB instance to be a Multi-AZ DB instance deployment.**
- D. Add a read replica in the same Availability Zone where the DB instance is deployed.

Answer: C

Explanation:

Modifying the DB instance to a Multi-AZ deployment is the recommended solution for failover and high availability in RDS. Multi-AZ RDS automatically provisions and maintains a synchronous standby replica in a different Availability Zone, allowing automatic failover in case of an instance or Availability Zone failure.

Multi-AZ Deployment: Provides resilience with automatic failover and minimizes application downtime.

No Application Changes Needed: Multi-AZ is managed by AWS, so the failover is transparent to the application.

Read replicas and Auto Scaling groups do not provide automatic failover for write operations, and RDS Proxy only improves

connection management rather than high availability.

NEW QUESTION # 237

A SysOps administrator is tasked with deploying a company's infrastructure as code. The SysOps administrator wants to write a single template that can be reused for multiple environments.

How should the SysOps administrator use AWS CloudFormation to create a solution?

- A. Use stack policies to provision resources
- B. Use Amazon EC2 user data in a CloudFormation template
- C. Use nested stacks to provision resources
- **D. Use parameters in a CloudFormation template**

Answer: D

Explanation:

Reuse templates to replicate stacks in multiple environments After you have your stacks and resources set up, you can reuse your templates to replicate your infrastructure in multiple environments. For example, you can create environments for development, testing, and production so that you can test changes before implementing them into production. To make templates reusable, use the parameters, mappings, and conditions sections so that you can customize your stacks when you create them. For example, for your development environments, you can specify a lower-cost instance type compared to your production environment, but all other configurations and settings remain the same. <https://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/best-practices.html#reuse>

NEW QUESTION # 238

A company hosts a web application on an Amazon EC2 instance in a production VPC. Client connections to the application are failing. A SysOps administrator inspects the VPC flow logs and finds the following entry:

What is a possible cause of these failed connections?

- A. The EC2 instance is shut down.
- B. The VPC has no internet gateway attached.
- **C. The network ACL is blocking HTTPS traffic.**
- D. A security group deny rule is blocking traffic on port 443.

Answer: C
