SAP Certified Associate - Integration Developer Sample Questions (Q50-Q55):

NEW QUESTION # 50

You have created an API provider of the type Internet. What http response code indicates success?

- A. 0
- B. 1
- C. 2

- **D. 3**

Answer: D

Explanation:

In API Management (Integration Suite), when you configure an API provider of type Internet, the system checks connectivity by sending a request to the backend.

HTTP 200 # Success (OK). The endpoint is reachable and functioning.

401 (Unauthorized) # Authentication failure.

403 (Forbidden) # Authorization failure.

502 (Bad Gateway) # Network or proxy error.

Therefore, the successful response code indicating proper connection is 200.

NEW QUESTION # 51

You want to use an HTTPS endpoint from an integration flow. In which of the following must you use the HTTP client?

- A. SAP Business Application Studio
- B. API Management capability within SAP Integration Suite
- C. SAP Integration Suite, advanced event mesh
- **D. Open Connectors capability within SAP Integration Suite**

Answer: D

Explanation:

To use an HTTPS endpoint from an integration flow, you can use the Open Connectors capability within SAP Integration Suite. Open Connectors is a feature that allows you to connect to over 160 third-party applications using standardized and normalized APIs. You can use the HTTP client connector to make HTTP or HTTPS requests to any endpoint that supports these protocols. You can configure the HTTP client connector with various parameters, such as URL, method, headers, query parameters, body, and authentication. Reference: Open Connectors | SAP Help Portal, HTTP Client Connector | SAP Help Portal

NEW QUESTION # 52

Which combination of event-driven architecture (EDA) patterns is supported by SAP Event Mesh?

- A. Choreography and Orchestration event-driven architecture patterns
- B. Request/Reply and Message Queuing event-driven architecture patterns
- **C. Publish/Subscribe and Point-to-Point event-driven architecture patterns**
- D. Publish/Subscribe and Event Sourcing event-driven architecture patterns

Answer: C

Explanation:

SAP Event Mesh supports:

Publish/Subscribe # A single event published by a producer can be consumed by multiple subscribers.

Point-to-Point (Queue-based) # Messages sent directly from producer to consumer via queues.

Other options are incorrect:

Event Sourcing is not part of SAP Event Mesh capabilities.

Request/Reply is synchronous, not the main EDA pattern.

Choreography/Orchestration are higher-level process design concepts, not the eventing patterns.

NEW QUESTION # 53

You have created a product based on an API proxy, but you have not published the product yet. What is a consequence?

- A. The product is displayed in the API Business Hub Enterprise with the note "not published".
- B. The product is displayed in the API Business Hub Enterprise but is grayed out.
- **C. The product is not displayed in the API Business Hub Enterprise.**

Answer: C

Explanation:

In API Management (part of SAP Integration Suite), when you create an API Product (which bundles API Proxies for consumption):

Publishing is required before it becomes visible in API Business Hub Enterprise (Developer Portal).

If the product is not yet published, it remains in the design-time environment and is invisible to app developers.

Only published products are available for subscription and discovery.

Other options:

The product will not be shown grayed out or with a "not published" note; it simply won't be visible at all in the Business Hub Enterprise.

NEW QUESTION # 54

What must you do to find out which entity sets are available in the OData V2.0 interface?

- A. Retrieve the metadata document from the interface.
- B. Contact the OData interface manufacturer
- C. Search in the Global Directory of all available OData interfaces.
- D. Retrieve the service document from the interface.

Answer: A

Explanation:

To find out which entity sets are available in the OData V2.0 interface, you must retrieve the metadata document from the interface. The metadata document is an XML document that describes the data model of the OData service, including the entity types, entity sets, associations, functions, and actions. The metadata document can be accessed by appending \$metadata to the service root URL of the OData service. For example, if the service root URL is <https://services.odata.org/OData/OData.svc/>, then the metadata document URL is [https://services.odata.org/OData/OData.svc/\\$metadata](https://services.odata.org/OData/OData.svc/$metadata). The metadata document can be used to discover the structure and capabilities of the OData service and to generate client code or proxies.
