Guide UiPath-ADAv1 Torrent, Associate UiPath-ADAv1 Level Exam

Passing the UiPath UiPath-ADAv1 certification exam is not a tough thing to do but we make it so. The main reason is that we don't know how to study from the UiPath-ADAv1 exam questions we have. We assume that we can study one night and can easily take the UiPath Automation Developer Associate v1 Exam UiPath-ADAv1 Exam the next morning. This was possible only when we were the school. Now, it is not possible.

UiPath Automation Developer Associate v1 Exam Sample Questions (Q140-Q145):

NEW QUESTION # 140

Following best practices, which activity is recommended for a developer to generate separate sets of actions for each vendor when developing a process that performs background verification for documents from 10 distinct vendors, each with varying document formats and requiring unique processing?

- A. Flow Switch
- B. Do While
- C. Flow Decision
- D. For Each

Answer: A

Explanation:

The Flow Switch activity is best suited for handling multiple distinct cases, such as processing documents from different vendors,

where each vendor requires a unique set of actions.

* Flow Switch is similar to a "Switch Case" in programming and allows for better readability and efficient branching logic.

* It is more scalable than using multiple If or Flow Decision activities.

Why other options are incorrect:

* A (For Each): Iterates through a collection but does not handle conditional branching effectively.

* B (Do While): Executes a loop until a condition is met, but not ideal for decision-based branching.

* C (Flow Decision): Good for binary decisions (True/False) but inefficient for multiple conditions.

NEW QUESTION # 141

A developer wants to extract hidden text from a pdf file. Which output method(s) should be used?

- A. OCR
- B. FullText only
- C. Native only
- D. FullText and Native

Answer: B

Explanation:

Explanation

To extract hidden text from a pdf file, the output method that should be used is FullText only. The FullText output method is one of the options available in the Read PDF Text activity, which reads all the characters from a specified pdf file and stores them in a string variable³. The FullText output method extracts the text from the pdf file as it is, without keeping the formatting or the position of the text. The FullText output method can also extract the hidden text from the pdf file, which is the text that is not visible on the screen, but can be copied and pasted into another application⁴. For example, the hidden text can be the metadata, comments, or annotations of the pdf file. The FullText output method is suitable for extracting hidden text from a pdf file, as it does not depend on the visibility or the layout of the text. The other output methods, such as Native or OCR, are not suitable for extracting hidden text from a pdf file, as they rely on the appearance or the position of the text on the screen. The Native output method preserves the formatting and the position of the text, but it cannot extract the text that is not visible or selectable⁵. The OCR output method converts the text from the pdf file into an image and then extracts the text from the image, but it cannot extract the text that is not displayed or recognized by the OCR engine⁶.

NEW QUESTION # 142

What is a pre-requisite for running functional test cases in REFramework?

- A. Invoke Process XAML file
- B. Invoke Main XAML file
- C. Invoke SetTransactionStatus XAML file
- D. Invoke InitAllSettings XAML file

Answer: D

Explanation:

A pre-requisite for running functional test cases in REFramework is to invoke the InitAllSettings XAML file, which initializes the application, reads the configuration file, and sets the log level. This file is invoked in the Init state of the Main XAML file, which is the entry point of the REFramework. By invoking the InitAllSettings file, you can ensure that the test cases have access to the necessary settings and parameters for the automation project. NEW QUESTION # 143

What happens when the area selection feature in the UiPath Computer Vision wizard is used?

- A. The selected area is automatically resized to fit all UI elements within it.
- B. The selected area is treated as a single UI element, with no further analysis of its contents.
- C. A portion of the application UI can be selected, which is helpful when dealing with multiple fields bearing the same label.
- D. A duplicated UI can be selected, and the copy is modified in the automation process.

Answer: C

Explanation:

The area selection feature in the UiPath Computer Vision wizard is used to refine the scope of the UI elements that are detected by the Computer Vision activities¹. By using this feature, you can select a specific region of the application UI that you want to automate, and the wizard will only show the UI elements within that region. This is helpful when dealing with multiple fields bearing the same label, such as "Name" or "Address", as you can select only the field that you want to interact with². The selected area is not automatically resized, treated as a single UI element, or duplicated by the wizard.

NEW QUESTION # 144

Data from an Excel file is read into a data table named "dtEmployee", as displayed in the following graphic:

A developer needs to filter the data table to obtain all rows representing employees from the Finance and IT departments with a Salary under 30,000. Which expression yields the desired outcomes?

- A. dtEmployee.Select("[Department]='IT' AND [Department]='Finance' AND [Salary] < 30000")
- B. dtEmployee.Select("[Department]='IT' OR [Department]='Finance' OR [Salary] < 30000")
- C. dtEmployee.Select("[Department]='IT' OR [Department]='Finance' AND [Salary] < 30000")
- D. dtEmployee.Select("[Department]='IT' OR [Department]='Finance' AND [Salary] < 30000")

Answer: C

Explanation:

This expression filters the data table to obtain all rows representing employees from the Finance and IT departments with a Salary under 30,000. The expression uses the Select method of the data table, which returns an array of data rows that match a specified condition. The condition is written as a string that follows the syntax and rules of the DataColumn.Expression property. The condition uses parentheses to group the logical operators OR and AND, which have different precedence levels. The OR operator returns true if either operand is true, while the AND operator returns true only if both operands are true. The condition also uses single quotes to enclose the string values of the Department column, and the less than operator to compare the numeric values of the Salary column.
