Instant Salesforce Plat-Admn-301 Download, Latest Plat-Admn-301 Examprep

There are only key points in our Plat-Admn-301 Training Materials. From the experience of our former customers, you can finish practicing all the contents in our training materials within 20 to 30 hours, which is enough for you to pass the Plat-Admn-301 exam as well as get the related certification. That is to say, you can pass the Salesforce Certified Platform Administrator II exam as well as getting the related certification only with the minimum of time and efforts under the guidance of our training materials. So what you are waiting for? Just come and buy them!

Salesforce Certified Platform Administrator II Sample Questions (Q126-Q131):

NEW QUESTION # 126

A sales rep at Urso Major Solar was assigned to a role under their manager and is the record owner of several opportunities; however, the sales rep is missing from the manager's forecast.

What should the administrator review to solve this issue?

- A. Enable manager adjustments
- B. Allow Override Forecasts
- C. Enable owner adjustment
- D. Allow Forecasting

Answer: D

Explanation:

Allow Forecasting is what the administrator should review to solve this issue. Allow Forecasting is a user permission that enables users to access and edit forecasts. If a user does not have this permission, they will not be able to see their own forecast or any forecasts below them in the role hierarchy. Therefore, the administrator should make sure that the sales rep has this permission enabled on their profile or permission set.

NEW QUESTION # 127

Northern Trail Outfitters has many users set up as system administrators to perform Salesforce Administration.

Which two functions would a delegated administrator be able to perform in order to help the existing Salesforce Administrator?

Choose 2 answers

- A. Manage custom objects and customize nearly every aspect.
- **B. Set up users and password management.**
- **C. Configure updates to sharing rules.**
- D. Make updates to permission set configurations.

Answer: B,C

Explanation:

Delegated administrators in Salesforce are designated users who are given limited administrative privileges to assist system administrators without having full access to all administrative functions. The two functions they can typically perform, which align with the permissions available to delegated admins, are:

* Set up users and password management:

* Delegated administrators can create and manage user accounts, which includes setting up new users, resetting passwords, and updating user details.

* This is particularly useful for helping with user management tasks without providing full system administrator access.

* Configure updates to sharing rules:

* Delegated administrators can manage sharing rules within their specific groups or roles, which helps control access to records based on criteria set within the organization.

* This level of access allows them to modify sharing rules to ensure appropriate data access without requiring full administrative control over all settings.

The other options listed are not within the scope of delegated administrator capabilities:

* Manage custom objects and customize nearly every aspect: Delegated administrators do not have the ability to manage custom objects or perform extensive customization. These functions are reserved for system administrators with broader privileges.

* Make updates to permission set configurations: Delegated administrators cannot create or modify permission sets. This is also restricted to full administrators, as it involves controlling access at a granular level across the org.

By utilizing delegated administrators for user and sharing rule management, organizations can maintain security and control while also sharing some administrative workload.

Reference: According to Salesforce documentation, delegated administrators have specific permissions, such as managing users and sharing rules, which support system administrators while limiting access to high-level customizations and configurations.

NEW QUESTION # 128

When should an administrator apply a permission set to a user or group of users versus configuring the user's profile with the necessary access?

- A. When an organization has opted out of using the standard profiles and created custom profiles.
- B. When a user is part of a team with an assigned profile that covers the majority of their needs but requires just a little less access than the rest of their team.
- C. When an organization's sharing model is too broad and they need to restrict access beyond what their sharing model and existing profiles provide.
- **D. When a user is part of a team with an assigned profile that covers the majority of their needs but requires more access than the rest of their team.**

Answer: D

Explanation:

As explained in question 13, permission sets are collections of settings and permissions that give users access to various tools and functions without changing their profile or requiring multiple profiles for users who perform different tasks across apps in your org. Permission sets are useful when a user is part of a team with an assigned profile that covers the majority of their needs but requires

more access than the rest of their team for some specific tasks or functions. For example, a user may need access to a custom object or field that is not available to their profile, but only for a limited time or project. In this case, assigning a permission set to the user can grant them the additional access they need without affecting their profile or other users with the same profile. NEW QUESTION # 129

Cloud Kicks (CK) has a backup team of employees that helps short-staffed departments. These users could be working with sales one day and service the next. CK is implementing new Lightning record pages for each department so that they view records in a way that makes sense for each department.

How should the administrator ensure this is configured correctly?

- A. Adjust the profile of the backup users each day to align with the proper access they require.
- **B. Configure one app per department and activate record pages for each app.**
- C. Create permission sets for each department and assign them to the backup team users.
- D. Allow the backup team users to update their own profile with Delegated Administration.

Answer: B

Explanation:

Configuring one app per department and activating record pages for each app will ensure that users view records in a way that makes sense for each department. An app is a collection of items that work together to serve a particular function. An app can have different record pages for different objects and profiles. By activating record pages for each app, the administrator can customize what users see based on their app context. NEW QUESTION # 130

Cloud Kicks (CK) completed a project in a sandbox environment and wants to migrate the changes to production. CK split the deployment into two distinct change sets. Change set 1 has new custom objects and fields. Change set 2 has updated profiles and automation.

What should the administrator consider before deploying the change sets?

- A. Change set 2 needs to be deployed first.
- B. Both change sets must be deployed simultaneously.
- C. Automations need to be deployed in the same change set in order to be activated.
- **D. The Field-Level Security will not be deployed with the profiles in change set 2.**

Answer: D

Explanation:

When deploying profiles using change sets, the field-level security settings are not included unless the fields themselves are also part of the change set. Therefore, the administrator should consider adding the new custom fields to change set 2 along with the profiles, or manually adjust the field-level security after deployment.
