According to the survey, the average pass rate of our candidates has reached 99%. High passing rate must be the key factor for choosing, which is also one of the advantages of our ACD201 real study dumps. In order to get more chances, more and more people tend to add shining points, for example a certification to their resumes. What you need to do first is to choose a right ACD201 Exam Material, which will save your time and money in the preparation of the ACD201 exam. Our ACD201 latest questions is one of the most wonderful reviewing Appian Senior Developer study training dumps in our industry, so choose us, and together we will make a brighter future.

How to find a valid exam dumps providers which can elaborate on how to prepare you properly with more appropriate questions to pass ACD201 exams? Yes, here is your chance to know us. Our products are just suitable for you. Our ACD201 exam training dumps will help you master the real test and prepare well for your exam. If you worry about your exam, our ACD201 Exam Training dumps will guide you and make you well preparing, you will pass exam without any doubt.

## ACD201 Materials - ACD201 Best Preparation Materials

The price of the ACD201 test dumps is quite reasonable, no matter you are the students or the employees of the enterprise, you can afford it. ACD201 test dumps are verified by the specialists of the business, therefore the quality is ensured. Pass guarantee and money back guarantee for purchasing the ACD201 Test Dumps. Other questions or problem of the product can consult the live chat service staff or by email, we will reply you immediately.

## Appian Senior Developer Sample Questions (Q48-Q53):

### NEW QUESTION # 48

You're creating a point-of-sale (POS) system for a customer which can associate the items in a transaction to a customer based on a membership number. The item stock table and the customer sales record are hosted elsewhere and need to be written to via POST APIs from an Appian process model. This all occurs within a transaction process model that you're creating.

Which two steps should you perform to design your process model to improve process memory? (Choose two.)

- A. Add a terminate process node to the end of the process.
- B. Create the two POST APIs as synchronous subprocesses.
- C. Create the two POST APIs as asynchronous subprocesses.
- D. Ensure that the entire process is activity-chained so that the person entering the transaction knows when the process is completed.

**Answer: A,C**

Explanation:

Creating the POST API calls as asynchronous subprocesses allows them to run independently, reducing memory usage in the main process.

Adding a terminate process node at the end ensures the process completes and releases memory as soon as its work is finished.

### NEW QUESTION # 49

A view is created with the primary table PERSON and is joined using a left join with the APPOINTMENT table on the column "PERSON\_ID". There is a one-to-many relationship between the PERSON and APPOINTMENT tables.

A Custom Data Type (CDT) and a data store entity have been created based on this view, with the primary key being "PERSON\_ID".

Review the data presented in the PERSON and APPOINTMENT tables:

**PERSON\_ID PERSON\_NAME**

1101	John Doe
1102	Jane Doe
1103	Richard Doe

APPOINTMENT_ID	PERSON_ID	status
428	1101	Completed
429	1102	Completed
430	1101	New
431	1103	Completed
432	1101	New
433	1102	New
434	1101	New

Which two statements are true when the following query entity is executed? (Choose two.)

```

a!queryEntity(
  entity: cons!ABC_PERSON_APPOINTMENT_VIEW_DSE,
  query: alquery(
    logicalExpression: alqueryLogicalExpression(
      operator: "AND",
      filters: {
        a!queryFilter(
          field: "STATUS",
          operator: "=",
          value: "New"
        ),
        a!queryFilter(
          field: "PERSON_ID",
          operator: "=",
          value: "1101"
        )
      }
    ),
    pagingInfo: a!pagingInfo(
      startIndex: 1,
      batchSize: 1,
      sort: a!sortInfo(field: "PERSON_ID")
    )
  ),
  fetchTotalCount: true
)

```

appian

- A. Appian makes one more query to the database(other than the actual query to fetch the data) to get the totalCount based on the applied filters.
- B. Appian makes one more query to the database(other than the actual query to fetch the data) to get the totalCount based on the applied filters and paging info.
- C. result totalCount is 1
- D. result totalCount is 3

**Answer: A,C**

Explanation:

Appian makes an additional query to the database (other than the main query for data) to retrieve the totalCount when `fetchTotalCount: true()` is used.

The result totalCount is 1, as there is only one person (PERSON\_ID 1101) being filtered, even though there are multiple "New" appointments for that person; with a CDT based on PERSON\_ID as the primary key, only one row is counted per person.

## NEW QUESTION # 50

You're building a new application to track job applications for a local health club.

The owner wants to have one group of individuals perform the initial application review for completeness, a second group to manage the interview process, and a third group to make the actual hiring decisions.

Which design element should be implemented to best support a memory efficient application?

- A. Create an entity-backed record for each of the open positions.
- B. Break up the application into subprocesses representing each of the different stages of the process to reduce memory use.
- C. Create a synchronous process that accurately tracks a candidate's application from start to finish to ensure the hiring group has access to all the information necessary to make a decision.

**Answer: B**

Explanation:

Breaking up the application into subprocesses for each stage allows each part to be short-lived and releases memory as each subprocess completes, resulting in a more memory-efficient application.

## NEW QUESTION # 51

You need to write an expression to retrieve a list of all account managers who don't currently have an active customer account. Which code snippet should you use?

- A.

```
a!localVariables(
  local!domesticCustomers: rule!getAllDomesticCustomers(),
  local!internationalCustomers: rule!getAllInternationalCustomers(),
  local!customers: a!flatten(
    {
      local!domesticCustomers,
      local!internationalCustomers
    }
  ),
  local!customerManagers: index(local!customers, "manager", null),
  local!accountManagers: rule!getAccountManagersByRegionAndVertical(
    regions: rule!getAllRegions(),
    verticals: rule!getAllVerticals()
  ),
  local!AMsWithoutAccounts: reject(
    fn!isnull,
    a!forEach(
      items: local!accountManagers,
      expression: if(
        contains(local!customerManagers, fv!item),
        null,
        fv!item
      )
    )
  ),
  a!forEach(
    items: local!AMsWithoutAccounts,
    expression: rule!displayUserName(fv!item)
  )
)
```

- B.

```
a!localVariables(
  local!customers: {
    rule!getAllDomesticCustomers(),
    rule!getAllInternationalCustomers()
  },
  local!accountManagers: rule!getAccountManagersByRegionAndVertical(
    regions: rule!getAllRegions(),
    verticals: rule!getAllVerticals()
  ),
  local!AMsWithoutAccounts: difference(local!accountManagers, local!customers.m)
  a!forEach(
    items: local!AMsWithoutAccounts,
    expression: rule!displayUserName(fv!item)
  )
)
```

- C.

```
a!localVariables(
  local!domesticCustomers: rule!getAllDomesticCustomers(),
  local!internationalCustomers: rule!getAllInternationalCustomers(),
  local!customers: a!flatten({local!domesticCustomers, local!internationalCustomers}),
  local!customerManagers: index(local!customers, "manager", null),
  local!accountManagers: rule!getAccountManagersByRegionAndVertical(
    regions: rule!getAllRegions(),
    verticals: rule!getAllVerticals()
  ),
  local!AMsWithoutAccounts: difference(local!accountManagers, local!customerManagers),
  a!forEach(
    items: local!AMsWithoutAccounts,
    expression: rule!displayUserName(fv!item)
  )
)
```

Answer: B

Explanation:

Chosen snippet uses the difference() function to efficiently get all account managers who are not currently managers of any customer account. It directly compares local!accountManagers to local!customers.manager, resulting in a concise and optimal solution for retrieving account managers without an active customer account.

### NEW QUESTION # 52

You're designing a file upload process that integrates with an external document management system.

Part of this process is to develop a start form with a file upload component, so that the user can upload multiple files.

The business has requested that the maximum file size that can be uploaded through this process is 1GB.

Additionally, you're aware that the integration's API can accept files with a maximum file size of 3GB, but recommends no larger than 1GB.

Can the process be more performant without straining the application or integration?

- A. Yes. Request the business allows for these files to be uploaded as an overnight process by storing large files in a staging table, so that adequate resources are available.
- B. No. The file upload component is capable of accepting 1 GB files and the integration can handle this.
- C. Yes. Request the business reconsiders its requirements and find manual workarounds as it is not recommended to upload files of this size in both Appian and the integration.

#### Answer: A

Explanation:

While Appian and the integration technically support 1 GB file uploads, handling such large files during interactive sessions can negatively impact application performance, user experience, and resource utilization.

A better approach is to request that the business allow these files to be uploaded asynchronously (e.g., overnight batch process), by temporarily storing them (e.g., in a staging table or folder) and processing them when system load is lower. This makes the process more performant and reliable without straining Appian or the external system.

### NEW QUESTION # 53

.....

Forget complaining for your failure. Please think about why there are candidates to pass exam every day. Option is more important than effort sometimes. Appian ACD201 reliable exam collection pdf are being searched about 100,000 in the website every day. There are more than 600 candidates choosing valid Appian ACD201 reliable exam collection pdf every day. We help thousands of people clear exams every year. The success is close at hand, why do you grab it?
