Fortinet FCSS - Network Security 7.6 Support Engineer Sample Questions (Q28-Q33):

NEW QUESTION # 28

Which statement about protocol options is true?

- A. Protocol options allow administrators to configure the Any setting for all enabled protocols, which provides the most efficient use of system resources.
- B. Protocol options allow administrators to configure which Layer 4 port numbers map to upper-layer protocols, such as HTTP, SMTP, FTP, and so on.
- C. Protocol options give administrators a streamlined method to instruct FortiGate to block all sessions corresponding to disabled protocols.
- D. Protocol options allow administrators to configure a maximum number of sessions for each configured protocol.

Answer: B

NEW QUESTION # 29

Refer to the exhibit.

Output of diagnose npu np6 port-list on FortiGate 2000E

Chip	XAUI	Ports	Max Speed	Cross-chip offloading
np6_1	0	port1	1G	No
	0	port5	1G	No
	0	port9	1G	No
	0	port13	1G	No
	0	port17	1G	No
	0	port21	1G	No

-omitted-

A partial output of diagnose npu up6 port-list on FortiGate 2000E is shown. An administrator is unable to analyze traffic flowing between port1 and port17 using the diagnose sniffer command. Which two commands allow the administrator to view the traffic? (Choose two.)

- A.

```
diagnose npu np6 fastpath disable 1
```
- B.

```
config firewall policy
edit 5
set auto-asic-offload disable
end
next
edit 17
set auto-asic-offload disable
end
```
- C.

```
config system npu
set fastpath disable
end
```
- D.

```
diagnose npu np6 fastpath disable 0 17
```

Answer: A,B

Explanation:

The administrator cannot see traffic in the sniffer because it is being offloaded to the NPU (NP6). To view the traffic, offloading must be disabled so packets pass through the CPU.

* B. config firewall policy ... set auto-asic-offload disable: This is the recommended method to troubleshoot specific traffic. By disabling ASIC offloading in the relevant firewall policies (Policies 5 and 17 in the exhibit), traffic is forced to the CPU and becomes visible to the sniffer.

* C. diagnose npu np6 fastpath disable 1: This command temporarily disables the fastpath processing on the specific NP6 processor (ID 1) handling the ports. This forces all traffic handled by that NPU to the CPU, allowing the sniffer to capture it.

* Incorrect Options: Option A uses invalid syntax (port-list disable is not a valid command). Option D (config system npu) is not the standard method for granular troubleshooting.

NEW QUESTION # 30

When FortiGate enters conserve mode because of memory pressure, which action can FortiGate perform to preserve memory?

- A. FortiGate automatically reboots to clear memory and restore full operation.
- **B. FortiGate reduces or stops non-essential processes like logging and antivirus scanning.**
- C. FortiGate switches to a less memory-intensive inspection mode, such as flow-based inspection.
- D. FortiGate begins dropping all new sessions to protect resources.

Answer: B

Explanation:

The best verified answer is C.

The study guide says that when FortiGate is in conserve mode, it activates protection measures to recover memory space:

"System configuration cannot be changed"

"FortiGate skips quarantine actions (including FortiSandbox analysis)"

It also explains that inspection behavior can be reduced while in conserve mode:

"pass (default): All new sessions pass without inspection until FortiGate switches back to non-conserve mode."

"The av-failopen setting also applies to flow-based antivirus inspection." The FortiOS administration guide summarizes this behavior as:

"This causes functions such as antivirus scanning to change how they operate to reduce the functionality and conserve memory without compromising security." That is why C is the closest correct choice: FortiGate can reduce functionality of some processes, especially antivirus-related inspection, to preserve memory.

Why the other options are wrong:

A is wrong because FortiGate does not automatically reboot as a default conserve-mode action. A reboot can be configured through an automation stitch, but that is an optional administrator-defined response, not the built-in conserve-mode behavior B is wrong because the documentation does not say FortiGate switches from proxy-based inspection to flow-based inspection. Instead, it may pass traffic without inspection depending on av-failopen settings D is not generally correct for conserve mode. The study guide says FortiGate starts dropping new sessions only when memory usage exceeds the extreme threshold: "If memory usage exceeds the extreme threshold, all new sessions that require inspection (flow-based or proxy-based) are blocked." So the verified answer is: C.
