Our Identity-and-Access-Management-Architect exam braindumps provide you with a reliable, rewarding and easy way to know and grasp what your actual exam really requires. Our professionals regard them as the top Identity-and-Access-Management-Architect preparation questions for their accuracy, precision and superbly informative content. If you choose our Identity-and-Access-Management-Architect Practice Engine, you will find it is the best tool ever for you to clear the exam and get the certification.

Salesforce Identity-and-Access-Management-Architect certification exam is very important for every IT person. With this certification you will not be eliminated, and you will be a raise. Some people say that to pass the Salesforce Identity-and-Access-Management-Architect exam certification is tantamount to success. Yes, this is true. You get what you want is one of the manifestations of success. PassReview of Salesforce Identity-and-Access-Management-Architect Exam Materials is the source of your success. With this training materials, you will speed up the pace of success, and you will be more confident.

Identity-and-Access-Management-Architect Actual Dump & Reliable Exam Identity-and-Access-Management-Architect Pass4sure

They struggle to find the right platform to get actual Salesforce Certified Identity and Access Management Architect (Identity-and-Access-Management-Architect) exam questions and achieve their goals. PassReview has made the product after seeing the students struggle to solve their issues and help them pass the Identity-and-Access-Management-Architect certification exam on the first try. PassReview has designed this Identity-and-Access-Management-Architect Practice Test material after consulting with a lot of professionals and getting their good reviews so our customers can clear Identity-and-Access-Management-Architect certification exam quickly and improve themselves.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q238-Q243):

NEW QUESTION # 238

How should an Architect automatically redirect users to the login page of the external Identity provider when using an SP-Initiated SAML flow with Salesforce as a Service Provider?

- A. Set the Identity Provider as default and enable the Redirect to the Identity Provider setting on the SAML Configuration.
- B. Use visualforce as the landing page for My Domain to redirect users to the Identity Provider login Page.
- C. Enable the Redirect to the Identity Provider setting under Authentication Services on the My domain Configuration.
- D. Remove the Login page from the list of Authentication Services on the My Domain configuration.

Answer: A

Explanation:

Explanation

Setting the Identity Provider as default and enabling the Redirect to the Identity Provider setting on the SAML Configuration will automatically redirect users to the login page of the external Identity Provider when using an SP-Initiated SAML flow with Salesforce as a Service Provider¹. Option A is incorrect because Visualforce is not a supported method for redirecting users to the Identity Provider login page². Option B is incorrect because enabling the Redirect to the Identity Provider setting under Authentication Services on the My Domain Configuration will only redirect users to the Identity Provider login page when using an IdP-Initiated SAML flow³. Option C is incorrect because removing the Login page from the list of Authentication Services on the My Domain configuration will not affect the SP-Initiated SAML flow, and may cause other issues with authentication⁴.

NEW QUESTION # 239

Universal Containers (UC) is setting up Delegated Authentication to allow employees to log in using their corporate credentials. UC's security team is concerned about the risk of exposing the corporate login service on the Internet and has asked that a reliable trust mechanism be put in place between the login service and Salesforce. What mechanism should an architect put in place to enable a trusted connection between the login services and Salesforce?

- A. Include client ID and client secret in the login header callout.
- B. Enforce mutual authentication between systems using SSL.
- C. Set up a proxy server for the login service in the DMZ.
- D. Require the use of Salesforce security Tokens on password.

Answer: B

Explanation:

Explanation

To enable a trusted connection between the login services and Salesforce, UC should enforce mutual authentication between systems using SSL. Mutual authentication is a process in which both parties in a communication verify each other's identity using certificates⁷. SSL (Secure Sockets Layer) is a protocol that provides secure communication over the Internet using encryption and certificates⁸. By using mutual authentication with SSL, UC can ensure that only authorized login services can access Salesforce and vice versa. This can prevent unauthorized access, impersonation, or phishing attacks.

NEW QUESTION # 240

Under which scenario Web Server flow will be used?

- A. Used for server-side components when page needs to be rendered.
- B. Used for mobile applications and testing legacy Integrations.
- C. Used for verifying Access protected resources.
- **D. Used for web applications when server-side code needs to interact with APIS.**

Answer: D

Explanation:

Explanation

The web server flow is used for web applications when server-side code needs to interact with APIs. This flow implements the OAuth 2.0 authorization code grant type, which allows the web app to obtain an access token and a refresh token from Salesforce after the user grants permission¹. The web app can then use the access token to call the Salesforce APIs and use the refresh token to obtain a new access token when the previous one expires². The other options are not valid scenarios for using the web server flow. The web server flow is not used for server-side components when page needs to be rendered, as this does not involve API calls. The web server flow is not used for mobile applications and testing legacy integrations, as these scenarios are better suited for other OAuth flows, such as the user-agent flow or the password flow³. The web server flow is not used for verifying access protected resources, as this is a general purpose of OAuth, not a specific scenario for the web server flow. NEW QUESTION # 241

Which tool should be used to track login data, such as the average number of logins, who logged in more than the average number of times and who logged in during non-business hours?

- A. Login Report
- **B. Login Forensics**
- C. Login Inspector
- D. Login History

Answer: B

NEW QUESTION # 242

Refer to the exhibit.

Outfitters (NTO) is using Experience Cloud as an Identity for its application on Heroku. The application on Heroku should be able to handle two brands, Northern Trail Shoes and Northern Trail Shirts.

A user should select either of the two brands in Heroku before logging into the community. The app then performs Authorization using OAuth2.0 with the Salesforce Experience Cloud site.

NTO wants to make sure it renders login page images dynamically based on the user's brand preference selected in Heroku before Authorization.

what should an identity architect do to fulfill the above requirements?

- A. Authorize third-party service by sending authorization requests to the community-url/services/oauth2/authorize/cookie_value.
- B. For each brand create different communities and redirect users to the appropriate community using a custom Login controller written in Apex.
- **C. Authorize third-party service by sending authorization requests to the community-url/services/oauth2/authorize/expid_value.**
- D. Create multiple login screens using Experience Builder and use Login Flows at runtime to route to different login screens.

Answer: C

Explanation:

OAuth 2.0 is an open standard for authorization that allows a third-party application to obtain limited access to a protected resource on behalf of a user. To authorize a third-party service using OAuth 2.0 with the Salesforce Experience Cloud site, the identity

architect should do the following steps:

* Create a connected app for the third-party service in Salesforce. A connected app is an application that integrates with Salesforce using APIs and standard protocols, such as SAML, OAuth, and OpenID Connect. To create a connected app, you need to provide the basic information, such as the app name, logo URL, contact email, and API name. You also need to enable OAuth and configure the OAuth settings, such as the callback URL, the scopes, and the policies.

* Authorize the third-party service by sending authorization requests to the `community-url/services/oauth2/authorize/expid_value`. This is a special endpoint that allows you to specify an experience ID (expid) as a query parameter in the authorization request. The experience ID is a unique identifier for each experience (community or site) in Salesforce. By using this endpoint, you can dynamically render the login page images based on the user's brand preference selected in the third-party service before authorization.
