CompTIA Linux+ Certification Exam Sample Questions (Q854-Q859):

NEW QUESTION # 854

An administrator transferred a key for SSH authentication to a home directory on a remote server. The key file was moved to `.ssh/authorized_keys` location in order to establish SSH connection without a password. However, the SSH command still asked for the password. Given the following output:

Which of the following commands would resolve the issue?

- A. `ssh_keygen -t rsa -o .ssh/authorized_keys`
- B. `chown root:root .ssh/authorized_keys`
- C. `restorecon .ssh/authorized_keys`
- D. `chmod 600 .ssh/authorized_keys`

Answer: C

NEW QUESTION # 855

A Linux system fails to start and delivers the following error message:

Which of the following commands can be used to address this issue?

- A. `partprobe /dev/sda1`
- B. `mkfs.ext4 /dev/sda1`
- C. `fdisk /dev/sda1`
- D. `fsck.ext4 /dev/sda1`

Answer: D

Explanation:

The command `fsck.ext4 /dev/sda1` can be used to address the issue. The issue is caused by a corrupted filesystem on the `/dev/sda1` partition. The error message shows that the filesystem type is `ext4` and the superblock is invalid. The command `fsck.ext4` is a tool for checking and repairing `ext4` filesystems. The command will scan the partition for errors and attempt to fix them. This command can resolve the issue and allow the system to start. The other options are incorrect because they either do not fix the filesystem (`partprobe` or `fdisk`) or destroy the data on the partition (`mkfs.ext4`). NEW QUESTION # 856

A junior systems administrator recently installed an HBA card in one of the servers that is deployed for a production environment. Which of the following commands can the administrator use to confirm on which server the card was installed?

- A. `lspci | egrep 'hba|fibr'`
- B. `lspci | pgrep 'hba|fibr'`
- C. `lspci | zgrep 'hba|fibr'`
- D. `lspci | 'hba|fibr'`

Answer: A

Explanation:

`Egrep` is a shortcut to the `grep -E` command. The `-E` option allows the use of regular expressions for text filtering. For example: `+`, `|`, `()` etc.

NEW QUESTION # 857

Developers have requested implementation of a persistent, static route on the application server. Packets sent over the interface eth0 to 10.0.213.5/32 should be routed via 10.0.5.1. Which of the following commands should the administrator run to achieve this goal?

- A. route modify eth0 +ipv4.routes "10.0.213.5/32 10.0.5.1"
- **B. ip route add 10.0.213.5/32 via 10.0.5.1 dev eth0**
- C. echo "10.0.213.5 10.0.5.1 eth0" > /proc/net/route
- D. route -i eth0 -p add 10.0.213.5 10.0.5.1

Answer: B

NEW QUESTION # 858

A Linux system is failing to boot with the following error:

Which of the following actions will resolve this issue? (Choose two.)

- **A. Boot the system on a LiveCD/ISO.**
- B. Interrupt the boot process in the GRUB menu and add rescue to the kernel line.
- C. Fix the partition modifying /etc/default/grub and reboot.
- D. Execute grub-install --root-directory=/mnt and reboot.
- **E. Execute grub-install /dev/sdX and reboot.**
- F. Interrupt the boot process in the GRUB menu and add single to the kernel line.

Answer: A,E

Explanation:

Explanation

The administrator should do the following two actions to resolve the issue:

* Boot the system on a LiveCD/ISO. This is necessary to access the system and repair the boot loader. A LiveCD/ISO is a bootable media that contains a Linux distribution that can run without installation. The administrator can boot the system from the LiveCD/ISO and mount the root partition of the system to a temporary directory, such as /mnt.

* Execute grub-install /dev/sdX and reboot. This will reinstall the GRUB boot loader to the disk device, where sdX is the device name of the disk, such as sda or sdb. The GRUB boot loader is a program that runs when the system is powered on and allows the user to choose which operating system or kernel to boot. The issue is caused by a corrupted or missing GRUB boot loader, which prevents the system from booting. The command grub-install will restore the GRUB boot loader and fix the issue.

The other options are incorrect because they either do not fix the boot loader (interrupt the boot process in the GRUB menu or fix the partition modifying /etc/default/grub) or do not use the correct syntax (grub-install

--root-directory=/mnt instead of grub-install /dev/sdX or rescue or single instead of recovery in the GRUB menu). References: CompTIA Linux+ (XK0-005) Certification Study Guide, Chapter 8: Managing the Linux Boot Process, pages 265-266.
