CompTIA A+ Certification Exam: Core 2 Sample Questions (Q246-Q251):

NEW QUESTION # 246

A support technician must install software that allows a user to deliver a project status presentation to external stakeholders. Which of the following software types should the technician install?

- A. Secure file transfer
- B. RMM
- **C. Videoconferencing**
- D. WinRM

Answer: C

Explanation:

The user needs to deliver a project status presentation to external stakeholders, which implies hosting a meeting with screen sharing, invitations, and attendee management. Quentin Docter defines videoconferencing as screen-sharing software that allows more than one person to share screens and includes

"additional functionality, such as calendar invite, call-in numbers, and attendee management." He lists Microsoft Teams, WebEx, Zoom, and GoToMeeting as examples and states these tools "are often used to present ideas and collaborate between groups of people." That exactly matches presenting to external stakeholders.

The other options don't fit the requirement: WinRM is a Windows remote management protocol (administration, not presentations), RMM is used by IT providers to manage many systems remotely (not stakeholder presentations), and secure file transfer is for moving files rather than delivering a live presentation. Since videoconferencing platforms commonly provide screen sharing, chat, and meeting controls designed for external audiences, Videoconferencing (C) is the correct software type.

NEW QUESTION # 247

Which of the following is the best way to distribute custom images to 800 devices that include four device vendor classes with two types of user groups?

- **A. Use a network-based remote installation tool**
- B. Use a local image deployment tool for each device
- C. Use robocopy to move the files to each device
- D. Use xcopy to clone the hard drives from one to another

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In enterprise environments, network-based deployment solutions (such as Windows Deployment Services or SCCM) allow administrators to push images across the network to hundreds of devices efficiently. These tools support hardware-specific drivers (for different vendor classes) and can accommodate user-group configurations using task sequences or answer files.

A: and B (xcopy and robocopy) are file-level tools and not designed for full OS image deployment.

C: Using local tools per device is inefficient for large-scale rollouts (800 devices).

D: Network-based deployment is the industry standard for this scale.

NEW QUESTION # 248

A company is implementing the 3-2-1 backup rule. Which of the following should the company do?

- A. Keep all backup media on site for fast recovery.
- B. Perform both full and differential backups.
- C. Test the backup integrity every three weeks.
- **D. Use at least two different types of media.**

Answer: D

Explanation:

The 3-2-1 backup rule is specifically about number of copies, diversity of media, and offsite storage. "2" in 3-2-1 means using two different types of media. The All-in-One guide states the rule plainly: "keep at least three copies of your data on at least two different types of media... and store at least one copy offsite." Mike Meyers' Lab Manual repeats the same definition

word-for-word, emphasizing two different media types and one off-site copy.

Quentin Docter explains the same method and gives an example: original data plus an on-site backup, plus "a third copy... off site," such as backing up to the cloud.

Given the options, only D directly satisfies the "two different media" requirement. Option C contradicts the offsite requirement, option B invents a testing interval not defined by 3-2-1, and option A is about backup types rather than the core 3-2-1 rule. Therefore D is correct.

NEW QUESTION # 249

A user is attempting to run a high-end graphics application on a computer with integrated video, but the application fails to start, reporting that the system does not meet the minimum video RAM requirements. The computer has 16 GB of system RAM installed. Which of the following should the technician adjust to resolve this issue?

- A. System Configuration
- B. Device Manager
- C. Virtual RAM
- **D. BIOS options**

Answer: D

Explanation:

With integrated graphics, "VRAM" is often not dedicated memory on a discrete card-graphics may instead borrow system RAM .

Quentin Docter explains this directly: if the video card is built into the motherboard, it

"likely won't have its own memory but will share system memory," meaning the total system RAM is split between the OS and video usage. Docter then answers the key "where do I change this?" question: " Shared memory is configured in the system BIOS/UEFI ,"

and some BIOS/UEFI setups allow you to set aside a specific amount (example given: 512 MB) for video memory.

That is exactly why the machine can have plenty of DRAM yet fail a VRAM check: the BIOS/UEFI allocation for integrated graphics may be set too low. Adjusting BIOS/UEFI settings to reserve more memory for the integrated GPU is the most direct way to attempt meeting a VRAM requirement (when supported).

Device Manager and System Configuration won't change reserved video memory allocation, and "Virtual RAM" (paging) is unrelated to VRAM. Therefore, BIOS options is correct.

NEW QUESTION # 250

Which of the following provides disk encryption on computers running a Windows OS?

- A. FileVault
- **B. BitLocker**
- C. PowerShell
- D. Private Key

Answer: B

Explanation:

BitLocker is a full-disk encryption feature included with certain editions of Windows, designed to protect data by providing encryption for entire volumes.

BitLocker is the correct tool for disk encryption on Windows operating systems, providing full disk encryption.
