As long as you choose VCETorrent, we guarantee that you can pass the Cloud-Deployment-and-Operations certification exam!

### WGU Cloud Deployment and Operations Sample Questions (Q28-Q33):

#### NEW QUESTION # 28

(Which type of support plan provides a technical account manager and full use of Trusted Advisor?)

- A. Enterprise
- B. Standard
- C. Developer
- D. Business

**Answer: A**

Explanation:

The Enterprise support plan provides a technical account manager (TAM) and full use of Trusted Advisor, offering proactive guidance and comprehensive access to all checks. This plan is designed for large-scale, mission-critical workloads. The WGU Cloud Deployment and Operations Study Guide (Section 6.4, AWS Support Plans) states, "The Enterprise support plan includes a dedicated Technical Account Manager and full Trusted Advisor access, providing 24/7 support and proactive optimization recommendations." Developer, Standard, and Business plans offer limited or no TAM support and partial Trusted Advisor access.

#### NEW QUESTION # 29

(A company is using the CloudWatch agent on its EC2 Linux instances. The company needs to determine how long read requests have waited on the instance's I/O for proper sizing of the instance. Which metric should the company use?)

- A. disk\_read\_ops
- B. diskio\_read\_bytes
- C. diskio\_reads
- D. disk\_io\_time

**Answer: D**

Explanation:

The `disk\_io\_time` metric, collected by the CloudWatch agent on EC2 Linux instances, measures the total time (in milliseconds) that read and write requests have waited on I/O, helping to assess disk performance for instance sizing. The WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Agent Metrics) states, "The `disk\_io\_time` metric, available via the CloudWatch agent, tracks the time spent waiting for I/O operations, providing insight into disk contention for optimizing EC2 instance sizing." disk\_read\_ops, diskio\_reads, and diskio\_read\_bytes measure operation counts or bytes, not wait times.

#### NEW QUESTION # 30

(Which two locations can Amazon Inspector publish its findings in when it has detected an anomaly? Choose 2 answers.)

- A. CloudTrail
- B. SQS
- C. SNS
- D. CloudWatch

**Answer: C,D**

Explanation:

Amazon Inspector can publish its findings when detecting anomalies to Amazon SNS for real-time notifications and to CloudWatch for metric and event logging, enabling monitoring and response. The WGU Cloud Deployment and Operations Study Guide (Section

6.2, Amazon Inspector) states, "Inspector findings are published to SNS for immediate alerts and to CloudWatch for detailed logging, allowing integration with other AWS services for anomaly response." CloudTrail logs API calls, and SQS is a messaging queue, neither of which are primary destinations for Inspector findings.

#### NEW QUESTION # 31

(A company uses KMS for key management. The company has a requirement to ensure that cryptographic material is not used longer than a year. Which solution should be used to meet this requirement with the least amount of effort?)

- A. Develop a custom key encryption protocol for KMS
- **B. Enable automatic key rotation in KMS**
- C. Write a Lambda function to replace keys in KMS
- D. Move keys from KMS to CloudHSM

**Answer: B**

Explanation:

Enabling automatic key rotation in AWS Key Management Service (KMS) is the least effort solution to ensure cryptographic material is not used longer than a year. KMS automatically rotates the cryptographic material of symmetric customer master keys (CMKs) every 365 days, meeting the requirement without manual intervention. The WGU Cloud Deployment and Operations Study Guide (Section 6.3, KMS) states,

"Automatic key rotation in KMS rotates the backing key material every year for symmetric CMKs, providing a low-effort way to comply with key usage limits." Moving to CloudHSM, custom protocols, or Lambda functions require more effort and complexity.

#### NEW QUESTION # 32

(Which two retention periods are supported by Performance Insights? Choose 2 answers.)

- **A. 7 days**
- B. 1 day
- **C. 1 year**
- D. 2 years

**Answer: A,C**

Explanation:

Amazon RDS Performance Insights supports retention periods of 7 days and 1 year for storing performance data, depending on the configuration and edition. The default retention is 7 days for standard monitoring, while enabling enhanced monitoring or the Performance Insights extended retention feature allows data to be retained for up to 1 year. The WGU Cloud Deployment and Operations Study Guide (Section 7.2, Performance Insights) states, "Performance Insights offers a 7-day retention period by default, with an option to extend to 1 year for detailed historical analysis, supporting cost and performance optimization." Options A (1 day) and D (2 years) are not supported retention periods.
