## Appian Senior Developer Sample Questions (Q27-Q32):

### NEW QUESTION # 27

The synced record Task has a self-referential relationship defined in the column parentTaskId. There is a many-to-one record relationship between the id and parentTaskId called parentTask.

For a given task ID, you need to return the task name and the parent task name.

What should you do?

- A. Use a!queryRecordType() With a filter on the task id, with fields specified to return recordType!Task.name and recordType!Task.parentTask.name.
- B. Use a!queryRecordType() filtered on the task id once to return the task name and parent task ID. Query the record again to return the parent task name.
- C. Create a sync-time custom record field on the Task record called parentName. Specify this field to return in the query field selection.

**Answer: A**

Explanation:

A single a!queryRecordType() call filtered by the task's id and selecting both recordType!Task.name and recordType!Task.parentTask.name leverages the existing self-referential relationship, returning the task name and its parent's name in one efficient query without additional custom fields or extra queries.

### NEW QUESTION # 28

Which step should you perform to identify expression rules that have been causing or have caused performance issues in the past 30 days?

- A. Navigate to the Admin Console > Rule Performance tab.
- B. Monitor the runtime of all test cases.
- C. Examine the application server log

**Answer: A**

Explanation:

The Admin Console > Rule Performance tab provides metrics and insights on expression rules that have caused performance issues in the past 30 days, allowing you to identify and address slow-running rules.

### NEW QUESTION # 29

You're designing an integration object with JSON (application/json) as the content type.

Which two data types can be automatically converted to JSON in Appian? (Choose two.)

- A. Primitive data types
- B. Base64 documents inline with JSON
- C. HTML file type

- **D. Appian Custom data type**

**Answer: A,D**

Explanation:

Appian Custom data types (CDTs) can be automatically converted to JSON for integration.

Primitive data types such as text, number, and boolean are also automatically converted to JSON.

### NEW QUESTION # 30

You're performing System Integration Testing on a client's application that integrates with an external system.

In this instance, you're testing the application's interactions with external integrations to ensure that data is being handled correctly between the two systems. However, this step has been done manually and is time-consuming.

What should you do to make this process more efficient?

- **A. Utilize FitNesse for Appian to perform automated functional testing on the workflows that include integrated systems through a defined set of test cases.**
- B. Utilize Appian-Locust to develop and execute performance tests on the systems integrations by scripting a scenario where multiple users are interacting with the external systems simultaneously.
- C. Utilize the Postman API Platform to test the integrations with the external system and Appian's web APIs through a defined set of test cases.

**Answer: A**

Explanation:

FitNesse for Appian is designed for automated functional testing of Appian workflows, including those that call external integrations.

By building repeatable FitNesse test scripts that drive the end-to-end process, you can automatically verify that data is correctly sent to - and returned from - the external system each time, greatly reducing the manual effort of system-integration testing.

### NEW QUESTION # 31

You're building an order management system.

You need to create a field that displays the total number of days it took to deliver each order, and show and sort by this data in a read-only grid. The data must be available in real-time.

Which function is the most appropriate for calculating this value?

- A. `calworkdays()`
- **B. `a!customFieldDateDiff()`**
- C. `a!subtractDateTime()`

**Answer: B**

Explanation:

`a!customFieldDateDiff()` is specifically designed for calculating date differences as custom record fields, enabling sorting and real-time calculation in read-only grids.
