

# Free MuleSoft-Integration-Architect-I Vce Dumps - Dumps MuleSoft-Integration-Architect-I PDF

P.S. Free 2026 Salesforce MuleSoft-Integration-Architect-I dumps are available on Google Drive shared by ITExamDownload: <https://drive.google.com/open?id=1N9MZE9fDvOPi1P5Yb4DRRXrEDBgHvIDR>

In this cut-throat competitive world of Salesforce, the Salesforce MuleSoft-Integration-Architect-I certification is the most desired one. But what creates an obstacle in the way of the aspirants of the Salesforce Certified MuleSoft Integration Architect I (MuleSoft-Integration-Architect-I) certificate is their failure to find up-to-date, unique, and reliable Salesforce Certified MuleSoft Integration Architect I (MuleSoft-Integration-Architect-I) practice material to succeed in passing the Salesforce MuleSoft-Integration-Architect-I certification exam.

Thus you can study Salesforce MuleSoft-Integration-Architect-I on your preferred smart device such as your smartphone or in hard copy format. Once downloaded from the website, you can easily study from the Salesforce MuleSoft-Integration-Architect-I Exam Questions compiled by our highly experienced professionals as directed by the Salesforce exam syllabus.

## Dumps Salesforce MuleSoft-Integration-Architect-I PDF - New MuleSoft-Integration-Architect-I Test Papers

The passing rate of our MuleSoft-Integration-Architect-I guide materials is high as 98% to 100% and you don't need to worry that you have spent money but can't pass the test. We can't list all the advantages with several words and please read the introduction of the features and advantages of our MuleSoft-Integration-Architect-I training quiz in detail on the website. You will find that every button on the page is fast and convenient to use. And we also have the free demos of the MuleSoft-Integration-Architect-I exam questions for you to download before purchase.

## Salesforce Certified MuleSoft Integration Architect I Sample Questions (Q40-Q45):

### NEW QUESTION # 40

Mule application A receives a request Anypoint MQ message REQU with a payload containing a variable- length list of request objects. Application A uses the For Each scope to split the list into individual objects and sends each object as a message to an Anypoint MQ queue.

Service S listens on that queue, processes each message independently of all other messages, and sends a response message to a response queue.

Application A listens on that response queue and must in turn create and publish a response Anypoint MQ message RESP with a payload containing the list of responses sent by service S in the same order as the request objects originally sent in REQU.

Assume successful response messages are returned by service S for all request messages.

What is required so that application A can ensure that the length and order of the list of objects in RESP and REQU match, while at the same time maximizing message throughput?

- A. Perform all communication involving service S synchronously from within the For Each scope, so objects in RESP are in the exact same order as request objects in REQU
- B. Use a Scatter-Gather within the For Each scope to ensure response message order Configure the Scatter- Gather with a persistent object store
- **C. Keep track of the list length and all object indices in REQU, both in the For Each scope and in all communication involving service Use persistent storage when creating RESP**
- D. Use an Async scope within the For Each scope and collect response messages in a second For Each scope in the order In which they arrive, then send RESP using this list of responses

#### Answer: C

Explanation:

Correct answer is Perform all communication involving service S synchronously from within the For Each scope, so objects in RESP are in the exact same order as request objects in REQU Explanation : Using Anypoint MQ, you can create two types of queues:

Standard queue These queues don't guarantee a specific message order. Standard queues are the best fit for applications in which messages must be delivered quickly.

FIFO (first in, first out) queue These queues ensure that your messages arrive in order. FIFO queues are the best fit for applications requiring strict message ordering and exactly-once delivery, but in which message delivery speed is of less importance Use of FIFO queue is no where in the option and also it decreased throughput. Similarly persistent object store is not the preferred solution approach when you maximizing message throughput. This rules out one of the options. Scatter Gather does not support ObjectStore. This rules out one of the options. Standard Anypoint MQ queues don't guarantee a specific message order hence using another for each block to collect response wont work as requirement here is to ensure the order. Hence considering all the above factors the feasible approach is Perform all communication involving service S synchronously from within the For Each scope, so objects in RESP are in the exact same order as request objects in REQU

#### NEW QUESTION # 41

A Mule application name Pub uses a persistence object store. The Pub Mule application is deployed to Cloudhub and it configured to use Object Store v2.

Another Mule application name sub is being developed to retrieve values from the Pub Mule application persistence object Store and will also be deployed to cloudbus.

What is the most direct way for the Sub Mule application to retrieve values from the Pub Mule application persistence object store with the least latency?

- **A. Use the Object store v2 REST API configured to access the Pub Mule application persistence object store.**
- B. Use an Anypoint MQ connector configured to directly access the Pub Mule application persistence object store
- C. Use an object store connector configured to access the Pub Mule application persistence object store
- D. Use a VM connector configured to directly access the persistence queue of the Pub Mule application persistence object store.

#### Answer: A

Explanation:

\* The Object Store V2 API enables API access to Anypoint Platform Object Store v2.

\* You can configure a Mule app to use the Object Store REST API to store and retrieve values from an object store in another Mule app. However, Object Store v2 is not designed for app-to-app communication. To share data between two Mule4 apps, use a queue in Anypoint MQ.

\* The Object Store v2 APIs enable you to use REST to perform the following:

- Retrieve a list of object stores and keys associated with an application.
- Store and retrieve key-value pairs in an object store.
- Delete key-value pairs from an object store.
- Retrieve Object Store usage statistics for your organization.
- Object Store provides these APIs:

Object Store API

Object Store Stats API

Reference: <https://docs.mulesoft.com/object-store/osv2-apis>

Additional Info:

When to use Object Store and when to use VM

#### NEW QUESTION # 42

An organization has just developed a Mule application that implements a REST API. The mule application will be deployed to a cluster of customer hosted Mule runtimes.

What additional infrastructure component must the customer provide in order to distribute inbound API requests across the Mule runtimes of the cluster?

- A. A database
- B. An Object Store
- C. A message broker
- D. **An HTTP Load Balancer**

**Answer: D**

Explanation:

Correct answer is An HTTP Load Balancer.

Key thing to note here is that we are deploying application to customer hosted Mule runtime. This means we will need load balancer to route the requests to different instances of the cluster.

Rest all options are distractors and their requirement depends on project use case.

#### NEW QUESTION # 43

An organization's security requirements mandate centralized control at all times over authentication and authorization of external applications when invoking web APIs managed on Anypoint Platform.

What Anypoint Platform feature is most idiomatic (used for its intended purpose), straightforward, and maintainable to use to meet this requirement?

- A. Identity management configured in access management
- B. **Client management configured in access management**
- C. External access configured in API Manager
- D. Enterprise Security module coded in Mule applications

**Answer: B**

#### NEW QUESTION # 44

A payment processing company has implemented a Payment Processing API Mule application to process credit card and debit card transactions. Because the Payment Processing API handles highly sensitive information, the payment processing company requires that data must be encrypted both In-transit and at-rest.

To meet these security requirements, consumers of the Payment Processing API must create request message payloads in a JSON format specified by the API, and the message payload values must be encrypted.

How can the Payment Processing API validate requests received from API consumers?

- A. The Mule application implementation can use the Validation module to decrypt and then validate the JSON data
- B. The Mule application implementation can use DataWeave to decrypt the message payload and then use the JSON Scheme Validation module to validate the JSON data
- C. **A Transport Layer Security (TLS) - Inbound policy can be applied in API Manager to decrypt the message payload and the Mule application implementation can then use the JSON Validation module to validate the JSON data**
- D. The Mule application implementation can use the APIkit module to decrypt and then validate the JSON data

**Answer: C**

Explanation:

To ensure that data is encrypted both in-transit and at-rest, and to validate incoming requests to the Payment Processing API, the following approach is recommended:

- \* TLS Inbound Policy: Apply a Transport Layer Security (TLS) - Inbound policy in API Manager. This policy ensures that the data is encrypted during transmission and can be decrypted by the API Manager before it reaches the Mule application.
- \* Decryption: With the TLS policy applied, the message payload is decrypted when it is received by the API Manager.
- \* JSON Validation: After decryption, the Mule application can use the JSON Validation module to validate the structure and content of the JSON data. This ensures that the payload conforms to the specified format and contains valid data.

This approach ensures that data is securely transmitted and properly validated upon receipt.

Transport Layer Security (TLS) Policies

JSON Validation Module

## NEW QUESTION # 45

.....

Our MuleSoft-Integration-Architect-I guide questions boost many advantages and varied functions. You can have a free download and tryout of our product before the purchase and our purchase procedures are safe. Our software carries no viruses and we provide 3 versions for you to choose. You need little time to learn the MuleSoft-Integration-Architect-I Exam Torrent and prepare the exam. Our passing rate and the hit rate is very high. After you pass the exam you will gain a lot of benefits such as enter in the big company and double your wage.
