May be there are many materials for Google practice exam, but the Professional-Cloud-Developer exam dumps provided by our website can ensure you the accuracy and profession. If you decided to choose us as your training tool, you just need to use your spare time preparing Professional-Cloud-Developer Free Download Pdf, and you will be surprised by yourself to get the certification.

Section 4: Integrating Google Cloud Services

The aim of this domain is to evaluate the learners based on their capacity to integrate an app with storage & data services, integrate an app with compute services, as well as integrate Cloud APIs with apps.

To become a Google Certified Professional - Cloud Developer, candidates must possess a thorough understanding of cloud computing concepts, such as distributed systems, service-oriented architecture, and containerization. Professional-Cloud-Developer Exam covers a wide range of topics, including GCP services such as App Engine, Compute Engine, Cloud Storage, Cloud SQL, and Cloud Pub/Sub, as well as developing cloud-native solutions using GCP tools and technologies such as Kubernetes, Cloud Functions, and Cloud Run. Google Certified Professional - Cloud Developer certification is suitable for developers who want to validate their skills in developing cloud-native applications on GCP and demonstrate their expertise in cloud computing to potential employers.

New Professional-Cloud-Developer Exam Duration | Latest Professional-Cloud-Developer Test Answers

Do not postpone seeking help from our extraordinary Google Professional-Cloud-Developer dumps to get the crucial Google Professional-Cloud-Developer certification exams. This platform allows you to self-assess your progress with a performance score. You can also customize your Google Professional-Cloud-Developer mock tests according to the time and kinds of practice queries.

It imitates the exact pattern of the actual Google Professional-Cloud-Developer certification exam.

Google Certified Professional - Cloud Developer Sample Questions (Q368-Q373):

NEW QUESTION # 368

You developed a JavaScript web application that needs to access Google Drive's API and obtain permission from users to store files in their Google Drives. You need to select an authorization approach for your application. What should you do?

- **A. Create an OAuth Client ID.**
- B. Create a service account.
- C. Create a SAML token.
- D. Create an API key.

Answer: A

NEW QUESTION # 369

When would a technician need to use a positive 'no' with a customer? (Choose three.)

- **A. The device is an obsolete device that we no longer service.**
- B. The technician does not feel like helping the customer.
- **C. The device is out of warranty.**
- D. The device is eligible for repair.
- **E. The customer is misinformed about service options.**
- F. Apple introduces new product.
- G. The customer wants to purchase a new device.

Answer: A,C,E

NEW QUESTION # 370

You are a cluster administrator for Google Kubernetes Engine (GKE). Your organization's clusters are enrolled in a release channel. You need to be informed of relevant events that affect your GKE clusters, such as available upgrades and security bulletins. What should you do?

- **A. Configure cluster notifications to be sent to a Pub/Sub topic.**
- B. Query the GKE API for available versions.
- C. Create an RSS subscription to receive a daily summary of the GKE release notes.
- D. Execute a scheduled query against the google_cloud_release_notes BigQuery dataset.

Answer: A

Explanation:

NEW QUESTION # 371

Your company has a BigQuery dataset named "Master" that keeps information about employee travel and expenses. This information is organized by employee department. That means employees should only be able to view information for their department. You want to apply a security framework to enforce this requirement with the minimum number of steps. What should you do?

- A. Create a dataset named Master dataset. Create a separate table for each department in the Master dataset. Give employees access to the specific table for their department.
- B. Create a separate dataset for each department. Create a view with an appropriate WHERE clause to select records from a particular dataset for the specific department. Authorize this view to access records from your Master dataset. Give employees the permission to this department-specific dataset.
- C. Create a dataset named Master dataset. Create a separate view for each department in the Master dataset. Give employees access to the specific view for their department.

- **D. Create a separate dataset for each department. Create a data pipeline for each department to copy appropriate information from the Master dataset to the specific dataset for the department. Give employees the permission to this department-specific dataset.**

Answer: D

NEW QUESTION # 372

Case Study 2 - HipLocal

Company Overview

HipLocal is a community application designed to facilitate communication between people in close proximity. It is used for event planning and organizing sporting events, and for businesses to connect with their local communities. HipLocal launched recently in a few neighborhoods in Dallas and is rapidly growing into a global phenomenon. Its unique style of hyper-local community communication and business outreach is in demand around the world.

Executive Statement

We are the number one local community app; it's time to take our local community services global. Our venture capital investors want to see rapid growth and the same great experience for new local and virtual communities that come online, whether their members are 10 or 10000 miles away from each other.

Solution Concept

HipLocal wants to expand their existing service, with updated functionality, in new regions to better serve their global customers. They want to hire and train a new team to support these regions in their time zones. They will need to ensure that the application scales smoothly and provides clear uptime data, and that they analyze and respond to any issues that occur.

Existing Technical Environment

HipLocal's environment is a mix of on-premises hardware and infrastructure running in Google Cloud Platform. The HipLocal team understands their application well, but has limited experience in global scale applications. Their existing technical environment is as follows:

- Existing APIs run on Compute Engine virtual machine instances hosted in GCP.
- State is stored in a single instance MySQL database in GCP.
- Release cycles include development freezes to allow for QA testing.
- The application has no logging.
- Applications are manually deployed by infrastructure engineers during periods of slow traffic on weekday evenings.
- There are basic indicators of uptime; alerts are frequently fired when the APIs are unresponsive.

Business Requirements

HipLocal's investors want to expand their footprint and support the increase in demand they are seeing. Their requirements are:

- Expand availability of the application to new regions.
- Support 10x as many concurrent users.
- Ensure a consistent experience for users when they travel to different regions.
- Obtain user activity metrics to better understand how to monetize their product.
- Ensure compliance with regulations in the new regions (for example, GDPR).
- Reduce infrastructure management time and cost.
- Adopt the Google-recommended practices for cloud computing.

Develop standardized workflows and processes around application lifecycle management.

Define service level indicators (SLIs) and service level objectives (SLOs).

Technical Requirements

- Provide secure communications between the on-premises data center and cloud-hosted applications and infrastructure.
- The application must provide usage metrics and monitoring.
- APIs require authentication and authorization.
- Implement faster and more accurate validation of new features.
- Logging and performance metrics must provide actionable information to be able to provide debugging information and alerts.
- Must scale to meet user demand.

For this question, refer to the HipLocal case study.

HipLocal's application uses Cloud Client Libraries to interact with Google Cloud. HipLocal needs to configure authentication and authorization in the Cloud Client Libraries to implement least privileged access for the application. What should they do?

- A. Create an API key. Use the API key to interact with Google Cloud.
- **B. Create a service account for the application. Export and deploy the private key for the application. Use the service account to interact with Google Cloud.**
- C. Create a service account for the application and for each Google Cloud API used by the application. Export and deploy the private keys used by the application. Use the service account with one Google Cloud API to interact with Google Cloud.
- D. Use the default compute service account to interact with Google Cloud.

Answer: B

NEW QUESTION # 373
